The author is, however, only dealing with the impact test in so far as it is of interest as indicating dangerous brittleness in steels from the engineer's point of view. From this standpoint it might be useful to endeavor to trace the mechanism of the action of rupture in one of these tests. For this purpose it is proposed to discuss the Izod test. The actual pressure exerted by the knife-edge on the piece is determined by the amount of resistance which the piece offers to deformation. The resistance commences at zero and increases rapidly at first, presumably in proportion to the deviation of the piece from the vertical. This phase will only continue during elastic deformation (which is extremely small), owing to the piling up of the stress near the bottom of the notch, and the elastic limit of the material will be reached locally at a very early stage, whilst the remainder of the test-piece will be almost unaffected. At this stage plastic deformation commences. In non-brittle materials it is to be anticipated that plastic deformation will then proceed, with the drawing out longitudinally and contraction of area of the steel close to the bottom of the notch taking place. The region affected plastically will gradually enlarge, the outlying portions being always less severely strained than the original base of the notch. In this way the deformation continues until the most drastically deformed portion has received the maximum drawing out of which it is capable, and then it will crack. The crack, once in existence, will rapidly spread. The base of it (when definitely formed) being sharper than any notch made by machining, causes such abnormal local stressing relative to the surrounding material, that the original crack always extends in preference to rupture, commencing afresh at any other point. The back face of the test-piece (not notched) is all the time under compressive stresses, but owing to the more uniform distribution, the actual maximum compressive stress at any point, before permanent deformation occurs, is very small in comparison with the tensile stress at the notch. During the plastic deformation, however, this compressive stress increases, and it may reach such a value that locally there may be fracture by shearing, and an appreciable bulging similar to, but not so marked as, that of the ordinary bend-test. A slight modification of shape of section on the notched side, feebly imitating that in an ordinary bender, is to be expected. The form of fracture usually indicates whether an appreciable amount of plastic deformation has taken place at the fractured portion, previous to the progression of the crack. In brittle materials the "crack" appears to be first started at a very early stage of the plastic deformation. It may be suggested that the bulk of the energy absorbed in the test is that due to the work done on the test-piece, in plastic deformation previous to the commencement of the crack, very little being absorbed before this begins (elastic deformation), and very little after, that is, during the extension of the crack. The relative proportions of the three stages of work will obviously vary with different materials, or conditions of the same material. It would appear from this argument that a governing factor in determining the amount of energy absorbed in the test is the degree to which the material can be plastically deformed before the formation of a "crack." This would be expected to run parallel with the elongation per cent. of a tensile test-piece (or preferably with the reduction of area per cent.) and a low elastic. While this generalization is in the main borne out by impact values, the agreement is only approximate, and, as previously discussed, there are exceptions. It must, therefore, be concluded that failure as at a shoulder or the bottom of a notch, is determined not only by the degree of deformation but also by the manner of distribution of the stresses.

In the latter sections of this paper results of experimental work will be given in illustration of the diverse values obtained from different materials, and at this stage the author proposes to content himself by showing that even wrought-iron of the highest ductility is susceptible to variations in notched impact test values, the values under static test remaining practically constant. He was successful in obtaining a bar of excellent wrought-iron. In Fig. 7, page 228, will be found the microstructure of this material in the condition as received, at 100 diameters and 500 diameters respectively. It will be seen to consist entirely of iron crystals, the only other constituent being a little slag left in during the process of manufacture. Any slag present in the test-bars experimented upon ran the length of the bar, being striated at right angles to any blows reviewed in impact testing. Chemical analysis curiously enough showed that this specimen of wrought-iron contained a little carbon, the value being somewhere between 0.05 per cent. and 0.08 per cent. As regards other constituents, the silicon was 0.03 per cent., manganese 0 08 per cent., sulphur 0.013 per cent., and the phosphorus 0.019 per cent. It will thus be seen that we have here an exceptionally pure commercial wrought-iron. Tensile, Izod impact, and Brinell determinations were done upon this material in different conditions, and the figures derived from determinations on a selection of the treatments are given in Table I.

These experiments establish that in a most ductile iron with an elongation of 40 per cent., and a reduction of area of over 60, the impact values may vary from over 70 down to nearly 20 without the values under the static test being seriously affected. These few tests have been selected from an investigation at present in progress, and the author does not propose to burden his paper with a metallurgical discussion of the results. Suffice it that here we definitely have curious anomalies from the metallurgical standpoint. but data sufficient to show that even the most ductile materials can

be made susceptible to notch brittleness without their ductility having been destroyed. The micro-examination of impact test-pieces after deformation has already been published by the author.*

The question which has to be decided is whether we must dissociate notch brittleness from true brittleness, which must be admitted is occasionally experienced in steels; but the author proposes to defer his deductions until the concluding pages of this work. The problem to be solved is this: can, and will really brittle steel give satisfactory results under static tests, or does it need a sharp notch to bring out the evidence of brittleness.

From a theoretical point of view it is eminently desirable that we should form some idea as to the reason for variable values obtained from notched-bar tests, other values being constant. Captain Philpot in his paper, to which reference has already been made, suggested segregation between the crystals as the cause, but the author cannot accept that explanation, since he has difficulty in conceiving the segregation of material in terms of the size of crystals at a temperature at which such effects are known by metallurgists to be produced. If two pieces of suitable nickel-chrome are hardened and are then subsequently tempered, say at 600 deg. C., one being quenched in water and the other being very slowly cooled, it will be found that the one which has been quenched from the tempering temperature in water will have a high impact value, whilst the one which is cooled slowly will have a low one. This is a statement which applies to many, though not all steels, and which is now definitely accepted by metallurgists. It is the author's experience, and he knows it is also the experience of many others that the microscope utterly fails, even at the higher powers at present available, to bring out any adequate indication of differences in structure sufficient to account for the large difference in impact value. It therefore follows that it is reasonable to suppose the cause to be more deep-seated and probably lies in the ultra-microscopic arrangement of the material. It has occurred to the author that if the ultimate arrangement of the atoms could be visualized it would be found that, on quenching from the tempering temperature, the material had been trapped in a—from a crystalline standpoint—meta-stable condition, that is, the atoms would not have had the opportunity of finally attaining their stable positions in the systems of the crystals. He would therefore suggest that if after the tempering has been done at temperatures such as that under discussion, and the cooling be permitted to take place at a slow rate, resulting in a low impact value, the atoms have had the necessary time and opportunity to take up their stable situations in the crystal.

He would then argue that the reason for the difference in the manner in which the crack is extended is to be found in the relative facility with which it can travel through the diversely orientated crystals. It appears to him to follow that in a perfect crystal, cleavage planes mill offer planes of weakness along which the crack may readily run, whilst in the unstable state in which the perfection of the arrangement is not attained, he would submit that it is conceivable that the crack will not travel with the same ease. It will be seen that this line of reasoning would presuppose fracture through crystals in both ductile and "notch-brittle" material. This is contrary to the views held by some investigators, but the author, in all seriousness, considers that it yet remains to be demonstrated that fracture frequently takes place along the crystalline boundaries. For instance, he would argue in this way: a crystalline fracture leads one to suppose that there are a number of minute planes reflecting light. Since the crystals of the metal with which we are dealing have no external geometrical form, it is difficult to conceive how such externals of the crystals, if they were separated, could present facilities for the reflection of light in the manner which to him appears perfectly obvious from crystalline fractures. It might, therefore, be thought that he would suggest that the fibrous fracture associated with high impact values with its non-crystalline appearance, would represent the separation between the crystals; such, however, is not his view, since he holds that in the fibrous fracture a sufficient explanation is found of the fact that in the transit of the crack through the crystal in this case, there is a good deal of deformation and distortion along the cleavage faces. Arguing back from the above to the region of fact, it will be remembered that we have a mass of evidence to show that most successful parts which have been submitted to the most stringent service, have had a low impact value. The inference which might be made from the foregoing is that the impact values induced by quenching from tempering temperature, involving as they do a meta-stable condition from a crystalline standpoint, also involve a crystalline instability which will probably be affected by the work which the parts are called upon to do under certain conditions of service. One fact is, however, obvious, that if it is necessary to quench from tempering temperatures to obtain high impact values, internal stressing will accompany the result, and it is an open question whether, if for no other reason, it is not better to be satisfied with reasonable impact values produced by relatively slow cooling rather than endeavor to produce the other condition of the material.

A Truly Bad Condition

Some time ago the author investigated the properties of a nickel-chrome forging which had been placed in a bad condition by an unsatisfactory final treatment. The intimation was that the Izod test-pieces in breaking absorbed no energy. The latter comment was somewhat exaggerated. However, the results of a detailed investigation into the mechanical properties are instructive. The figures obtained were as follows:

Elastic limit	13.3 tons per sq. in.
Yield-point	32.1 tons per sq. in.
Maximum stress.	44.5 tons per sq. in.
Elongation	9.0 per cent.
Reduction of area	16.6 per cent.
Izod	3 ft.-lb.
Charpy	0.31 kgm. (2.2 ft.-lb).
Stanton	666 blows.
Brinell	210

It will be seen that the steel was in a really bad condition. The impact tests clearly showed brittleness, but this was also to be seen by the tensile in the low ductility. It may be stated that the tensile values were true ones, not being in any way affected by defects such as frequently reduce ductility. The true elastic limit was low as also was the Stanton result.

A shipbuilding record was made in Belfast, Ireland, recently when the workmen completed a ship in five working days after the vessel was launched.

In a paper recently read by D. M. Buck before the American Society for Testing Materials, it was brought out that very small amounts of copper have the effect of reducing corrosion in steel. Tests were made of open hearth steel with various copper additions, so that there was from 0.012 to 0.254 per cent. of copper in the ingots. These were rolled into sheets and exposed to the atmosphere in the Connellsville coke region, together with a number of pieces in which there was no copper. It was found that a mere trace of copper was sufficient to prevent rapid corrosion.

Those using articles made of rubber that frequently lose their elasticity through oxidization may restore the material to its original condition by a simple process. Soak the part in a mixture of one part of ammonia to two parts of water. It is particularly well adapted to the restoring of rubber bands, rings and small tubing that are ready to become dry and brittle.

An unusually large weld was made recently by the Thermit process on the stern frame of the SS. Northern Pacific, which was lying at New York. The frame was broken when the vessel run aground in a fog, and is a hollow casting about 2 ft. in diameter with walls 3 in. thick. The weld required 1,400 lb. of Thermit, and proved entirely successful.

The best practice, which is practically the same as the safest practice, in the use of dissolved acetylene under pressure for welding purposes, seems to be to limit the number of storage cylinders in the building, so far as practicable, to those in actual use, or enough additional cylinders to complete one day's work. Used cylinders should be removed from the premises and returned to the manufacturer for recharging as rapidly as possible.

Handling the Product by "Trucktractor"

A Very Novel Adoption of a Tractor and Truck Combination is Herein Described. Moving Freight Cars, Trailers or Other Vehicles Becomes Part of Its Day's Work, or It Can be Used Independently if Desired

By HARRISON JENKINS

A VERY interesting adoption of the tractor and truck combination as suited to shop conditions is shown in the various illustrations throughout this article.

The Clark Tructractor Co. of Chicago, Ill., are the makers of this type of truck, and Fig. 1 shows a separate view of the apparatus.

These trucks have proven themselves to be great labor savers, and well adapted for use in the machine shop and foundry. Such firms as the Hyatt Roller Bearing Co., Clark Equipment Co., Stewart Motor Truck Co., Barney-Floyd Co., Ohio Steel Foundries, National Malleable Casting Co., Jeffery Mfg. Co., and others, have found this truck a wonderful time saver.

Its flexibility is a big feature, as it can turn on a very short radius (see Fig. 2), which is a decided advantage in many cases. The design is such that the truck body is built so close to the ground, and is so powerful that it can be used for every purpose from carrying a full ton load of shavings from the lathe, foundry sand, red hot forgings or castings, finished or unfinished parts from one machine to another or between plants. It will operate on rough roads as well as on factory floors. It will plow through snow or mud, through foundry sand, or on oil-sodden floors.

It is built and put together by efficient and highly experienced workmen, under the supervision of high-class engineers, and made to stand up under the most severe industrial service.

Some of the tasks it has been performing for the past year and a half are as follows: Moving freight cars, heavily loaded trailers, and carrying loads up to a ton and a half constantly—day after day—without breakage or mechanical troubles. The fact that it operates on 8 gallons of gasoline, ordinary working day, makes it a most economical machine.

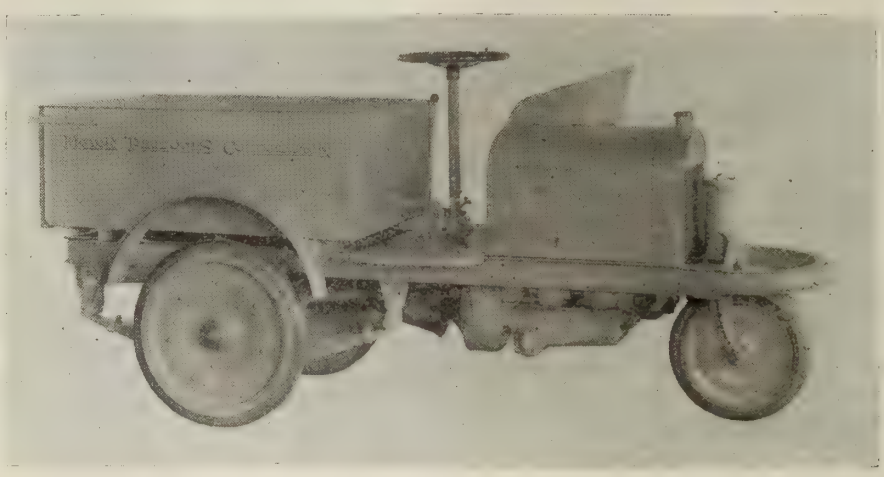

FIG. 1.—GENERAL APPEARANCE OF THE TRUCK.

Its ability to run 24 hours a day without being laid up for recharging and its economical operation, coupled with the lack of breakage, makes this machine an exceptionally efficient and satisfactory one for commercial purposes.

The fact of its having nine and one-half inches of ground clearance and an abundance of power, makes it possible to manipulate on rough ground, foundry floors, factory yards and bad roads. Sand and mud do not prevent this machine from successfully and quickly performing its duties under all weather and factory conditions.

Its great range of speed (from ½ of a mile of 15 miles per hour) permits the Clark tructractor to creep through congested places and around sharp corners, deliver its load exactly in the place desired, without danger to machinery or employees, and to run at high speed through open places and in the traffic of roads and city streets.

One of the machines was recently driven from Buchanan, Michigan, to Chicago, Illinois. This machine was stopped at several of the large industrial plants on the way and most interesting demonstrations were held. It covered a distance of 143 miles in one

FIG. 3.—USED IN CONJUNCTION WITH THE TRAILER.

FIG. 2.—TURNING IN A SHORT RADIUS.

FIG. 4.—USING THIS TYPE OF TRUCK IN THE FOUNDRY.

day and arrived in Chicago in first-class condition, ready to begin regular routine work in one of the well-known institutions.

The fact that this machine is built entirely of metal and that its centre of gravity is very low, makes it a most satisfactory one for foundry and forge shop use. Extreme changes in temperature do not affect its operation. Hot castings and forgings can be carried from one section of the plant to the other—quickly and without damage to the machine. It thus speeds up production, prevents congestion and increases the efficiency of these plants. It has a surprising drawbar pull and is capable of moving loaded freight cars without straining any of its parts. Heavy trailers are transported from one part of the plant to another at high or low speeds, ranging from ½ mile per hour to 15 miles per hour.

The truck is very simple to drive and operators soon become efficient and dart in and out of narrow doorways, here and there among the machines, into the sand blast rooms, about the foundry and along the highways, carrying material from department to department—from foundry to the shipping platform or station.

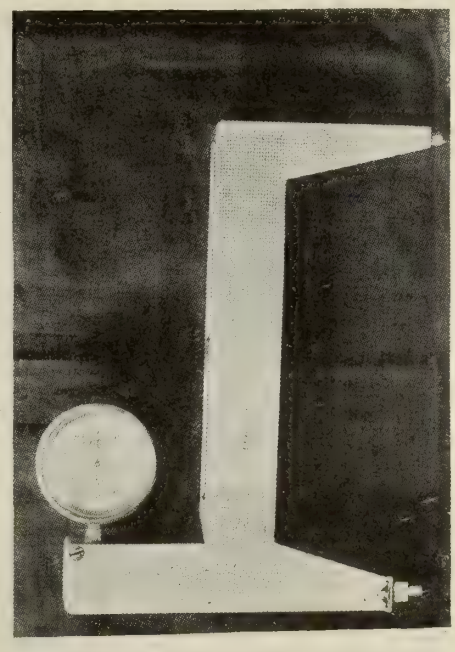
It has a carrying capacity of one and a half tons, and is supplied with either platform, cargo or dump body.

Other information desired will be given on request by the makers of this truck.

TESTING REINFORCED CONCRETE BUILDINGS WITH STRAIN GAUGE

By FRANK G. PERKINS

THE accompanying illustration shows the construction of a strain gauge of Professor H. C. Berry, of the University of Pennsylvania, for use in measuring strains in reinforced concrete buildings, as utilized by D. C. Hooker, of the Seattle Building Department. Its unusual features include a frame without rivets or screws, the side plates being joined to the spacing lugs by the electric welding process. It has checkered side plates to give better grip for the hands and a clearance of 3 in. to enable readings to be made on steel embedded deep in the concrete, also a specially constructed fulcrum joint for the movable leg. The one-piece frame is so rigid that side pressure, giving unconsciously when making observations, has comparatively little effect on the readings and there are no rivets or screws to work loose or throw unequal interior strains on the frame.



VIEW OF THE STRAIN GAUGE.

It is pointed out that the three-inch legs allow measurements on the deepest layer of steel in four-way flat slabs, and the checkered plates reduce the strain of continued reading by improving the grip of the hands on the instrument. The trunnions of the movable leg are held up into position in the notches of the frame by a spring, guarded by a cover plate. Both the spring and the cover plate are square, with a square hole in the centre of each through which the movable leg passes. The cover plate is held in place by four counter-sunk screws, which are screwed home in the frame and thus have no tendency to work loose.

It is held that as the instrument is used only in testing buildings, the gauge length is fixed at 8 in., this length being considered most practicable for all round use. The dial can be revolved any part or all of the revolution to eliminate parallel in reading on floors, ceilings or columns, and to permit the dial end to be held in either the right or left hand. It is of interest to note that the instrument is constructed throughout of Invar steel. The dial is an Ames gauge, graduated to thousandths of an inch, and as the proportions of the movable left are one to five, the instrument therefore records strains of .0002 in. The gauge was designed by D. E. Hooker and constructed for Professor Berry by F. F. Metzger, of Philadelphia.

GEARED HEAD LATHES

Lathes with geared heads for either belt or motor drive are announced by the Cisco Machine Tool Co., Cincinnati. The geared head on the belt-driven machine has a double friction countershaft, one friction running 300 r.p.m. and the other 130 r.p.m. The 300 r.p.m. friction has control of 10 spindle speeds, 300 and 200 with back gears out, 214, 146, 116, 78, 54, 36, 29, and 19 with back gears in.

The 130 r.p.m. friction has control of 10 spindle speeds, 130 and 88 with back gears out and 93, 63, 50, 34, 23, 15, 12, and 8.5 with back gears in. There are four levers, including the back gear lever, required for these changes. One handle controls the friction on the spindle and two handles control the shifting of four back gears on the eccentric shaft. A pull pin in the face gear is used to run straight from the spindle when the back gears are out. The eccentric shaft lever or back gear lever meshes back gears with spindle gears. On the spindle are a friction and six gears, on the back shaft four gears, on the drive shaft two years, all gears and spindles being of 0.40 to 0.45 carbon steel. Except the drive shaft gears, which are rawhide, all geared heads have ball bearings.

In applying the motor to the geared head a plate is placed on the top of the regular geared head with a bracket on the plate for an intermediate stud. On the intermediate stud is a rawhide intermediate gear. A pinion is placed on the motor and a gear on the drive shaft, both pinion and gear being made of steel. The gears are covered and the spindle speeds are 220 and 150 r.p.m. with back gears out and 158, 107, 86, 58, 40, 27, 21, and 14 with back gears in.

The lathes are made in four sizes, 14, 16, 18 and 24-in. For motor drive, these lathes require a 2½, 3, 5 and 7½-h.p. motor respectively. The manufacturer specifies a General Electric motor at 1,700 r.p.m. for direct current or a Westinghouse motor at 1,800 r.p.m.

A Detail Study of the Manufacture of Silica

A Complete Description of Its Analysis, Density, Porosity, Temperature, Etc., Are Contained Herein. To Those Interested in Such a Subject, This Article Should be of Keen Interest

By M. E.

THE manufacture of silica products employed in the Martin or similar furnaces is carried out with compact siliceous rocks, suitably ground, about 2 per cent. of slaked lime being then added, with sometimes a little clay or ground bauxite, and the whole is worked up into a body which can be moulded directly in metal moulds or by means of a machine press which gives sharp angles; it is not necessary to employ a powerful pressure. The pieces are afterwards dried, then carried to as high a temperature as possible in the kiln. The silica products met with in commerce can be arranged in three broad categories: (1) Those which include large grains; (2) those which include medium grains; (3) those which include small grains. These grains of rock, large or small, are all surrounded by a fine mass made by the mixture of finely ground lime and silica, forming a kind of cement adhering to the grains of rock.

Analysis of silica products can be made by two processes; either by the quantitative analysis of each of its elements, or by estimation in the state of sulphates of the elements of other than silica. In this last process, which is rapid but imperfect, the lime, alumina, etc., are treated all together, without paying attention to their proportions, but it is indispensable to know the quantity of alumina contained in these products, for, if it is in excess, it brings about a lowering of the softening and fusion points.

Physical studies of silica products comprise observations on changes of volume, density, porosity, and mechanical resistance under the influence of high temperatures. For this purpose tests are carried out: (a) On products such as proceed from factories; (b) on the same products submitted to 1,710 deg. C. for an hour or two, or to 1,650 degs. C. for the time necessary for their complete expansion.

The tests on products made by the trade include determination of density, porosity and resistance to crushing at ordinary temperature.

Density.—Apparent density and absolute density are measured; the measure of this last provides a first indication on the thermal conditions in which the product was burned. The density of quartz is about 2.66; under the action of heat, when it attains its total increase in volume the density is about 2.32. Quartzites present analogous results. The density of flint varies between 2.60 and 2.62; after burning at a high temperature this density is no more than 2.22. If, for example, this absolute density is not above 2.45 to 2.50, it is certain that the burning has neither been high enough nor long enough; if this density is below 2.40 and tends to approach 2.35, their burning can be considered satisfactory. Silica products based on compact flint present smaller absolute density, which should approach 2.25 and tend towards 2.22.

Porosity.—Porosity is determined by finding the weight of water which the very dry siliceous product absorbs during a stay of twenty-four hours in water. Porosity depends on several factors, and particularly on the nature of the rock, the size of the grains, the composition of the cement, etc. Certain bricks have a porosity of 8 per cent.; others have higher porosities, sometimes reaching 20 per cent. This porosity should increase when the products are heated to 1,710 degs. C., if they are of good quality, too great a porosity facilitates absorption of slags in the Martin furnace, and accelerates wear of the bricks.

Resistance to Crushing at Ordinary Temperatures

The resistance to crushing is very important. In Martin furnaces, and especially in the arches, the part of the products which is in contact with the gases in combustion increases in volume, the arches swell, and pressure—often very high—results in different directions. Just at the periods of tapping or of changing the furnaces there are great variations of temperature which bring about contractions or expansions. During these operations the bricks should resist changes of pressure without being crushed or cracked. The resistance to crushing at ordinary temperature is measured by the process adopted by the Conservatoire National des Arts et Metiers, where half bricks are operated on. This resistance depends on the quality of the grains of the rock, and the quality of the cement which surrounds then: it is greater when the porosity of the products is small. According to the physical properties of the products the resistance to crushing varies from 120 to 500 kilog. per sw. cm.

It is preferable to proceed with these tests on whole bricks which have been heated to 1,710 degs. This operation is performed in a Bigot and Bodin recuperating furnace. If the condition of the pieces permit, their expansion, density, porosity and resistance, to crushing tain only 85 per cent. of silica and 15 per cent. of foreign matters, are as rewhen cold and at 1,500 degs. are then determined. When taken from the recuperating furnace, if the pieces have been clearly softened and deformed, or have melted, they are of inferior quality and are not suitable for use in the Martin furnaces. Where they have resisted without either melting or being deformed three principal cases occur: (1) As the temperature is raised, the siliceous grains increase in volume and porosity. The cement which surrounds them is partially vitrified, contracts, and resists (without cracking) the expansion of the silica grains. Experience proves that the porosity of these products decreases in proportion as they are taken to higher temperatures, and that the best silica products present this peculiarity; (2) creased, their porosity has increased, and it more finely and not use large grains. In the case of Souvigny quartzite, which expands 10 per cent. and a quartzite American sandstone which expands 15 per cent., the volume of a cube of the first with side 10 becomes 1,331, at 1,710 degs., and a similar cube of the second becomes 1,520; the volume of the first gas increased 33.10 per cent., and that of the second 32 per cent. In order to obtain an equal increase of volume it would be necessary to crush the American sandstone finer than the Souvigny quartzite; (3) porosity, after heating to 1,710 degs., has slightly increased, resistance to crushing at ordinary temperature has perceptibly decreased, and resistance to crushing at 1,500 degs. has become null.

Careful examination shows that the grains of siliceous rock have become friable, the chief material employed being such as falls into powder at 1,710 degs. The porosity of these grains has increased considerably; the cement has preserved its consistency and has not cracked, but when a trial is made for resistance to crushing at 1,500 degs. the cement softens, and the grains no longer having any cohesion, the products crush under slight pressure. The quality of these products is defective; it is like those which are made with a mixture of rocks of good quality and rocks of which have become exhausted at high temperature.

The study of silica products with the microscope shows that tridymite is formed rather rapidly in the presence of lime at high temperature—this formation being much slower in the parts of rock grains which are not in contact with the lime.

It is rather difficult to state precise rules on the subject on account of the variety of the principal materials. The principal qualities required of silica products: (1) Refractoriness as high as possible and above 1,710 degs; (2) increase of volume as small as possible; (3) crushing resistance as high as possible when hot and at ordinary temperature; (4) small porosity. Attention should also be drawn to two particular points, the grinding the rock and the burning of the products.

The existing practice is to use heavy vertical mills. The ground material is

afterwards sifted in order to separate over-large grains, which are reground. The apparatus used in the sifting room allows no separation of very fine elements, fine, medium, and coarse. Vertical mills destroy part of the angles and the ground material is never of constant composition because it remains for a longer or shorter time in contact with the grinder, or because the pieces of rock to be crushed offer very variable resistances to crushing. It is certain that manufacturers will be induced, sooner or later, to make use of processes analogous to those used in the abrasives industry—crushing the rock, grinding in cylinders, a sifting which allows classification of the grains and separation of the fine dust constituting the basis of the cement which serves as agglomerant. These processes give grains with sharp edges. They allow exact determination of the proportions of grains of different sizes separated by the sifting rooms. Manufacturers will thus have the possibility of making products with angular grains, of constant composition as regards grain size, and including a known proportion of fine.

These products are burned at as high a temperature as possible, viz., about 1,600 degs., at which temperature a few hours' firing suffices in order to obtain a good result. At present most manufacturers use intermittent kilns, which only permit temperatures of about 1,400 degs. to be contained in the middle; it is necessary then to maintain the products at this temperature for long hours in order to obtain a transformation and a partial expansion of the silica; a considerable expenditure of fuel and a magnified duration of the burning result. In some of these kilns the setting in, the burning, the cooling, and the drawing from the kiln, require about three weeks.

As a result of repeated trials made in a tunnel kiln between 1,500 degs. and 1,550 degs., the duration of a good burning according to the tonnage to be produced per twenty-four hours, varies from four to five days from the moment the products enter into the tunnel until the moment they go out of it.

The examination of a number of bricks taken from open hearth furnaces shows the influence of density and porosity on crushing resistances; they give valuable indications as to the condition of the bricks in the furnaces and the essential principles which should be conserved in the management of these furnaces. It also demonstrates two very plain facts, contrary to the opinions generally approved at present, viz: (1) It is admitted that silica products are only of good quality if they include 94 to 95 per cent. of silica. But the experiments show that the grey parts of the bricks which contain only 85 per cent. of silica and 15 per cent. of foreign matter are as refractory as products with 95 per cent. of silica and that thanks to their feeble porosity they are far superior as regards crushing resistance at all temperatures; (2) It is equally admitted that an excess of lime and of iron oxide is detrimental in silica products, and that it is only necessary to exceed the proportion of 3 to 4 per cent. for these two elements combined. But in the grey part of the bricks the proportion of these two elements varies from 10 to 14 per cent.

The following table recapitulates some of the physical tests which have been made in the course of these studies:

(a) Brick of good quality.
(b) Brick which cracks at high temperature.
(c) Brick made with rocks friable at high temperature.
(d) Brick from a Martin furnace, unattacked part.
(e) Brick from a Martin furnace, brown part.

The crushing resistance is expressed as kilogms. per sq. cm.

INTERNATIONAL MACHINERY EXPOSITION ANNOUNCED

Announcement of the International Machinery Exposition to be held in Grand Central Palace, New York City, has been made by the Merchants' and Manufacturers' Exchange of New York. This is to be one of the most advanced steps made in the machinery industry since the war ended, and will be a permanent affair. October 15th is scheduled as the opening date, at which time it is expected that hundreds of machines will be in actual operation on the floor. The exposition will occupy 50,000 square feet of floor space, in the high structure, which is the largest exposition building in the world and will include a most comprehensive display of modern engines, lathes, milling machinery, planers, drills, screw cutters, presses, boring, can-making, woodturning machines, etc.

The Merchants' and Manufacturers' Exchange, which operates Grand Central Palace, is owned and controlled by the Nemours Trading Corporation, of which Alfred I. duPont is president. It has nineteen branches and 3,000 selling agencies throughout the world, and is one of the most remarkable organizations of the sort in existence. The Merchants' and Manufacturers' Exchange will operate eight permanent industrial expositions in the Palace on the eight upper floors of the 12th storey building. The four lower floors will be used for temporary exhibit, such as the annual automobile show, motor boat, flower show, etc.

Visitors at the International Machinery Exposition will also find the other expositions in this building of considerable interest, included among them are the International Factory Appliance Exposition, International Mining Machinery Exposition, International Farm Tractor and Implement Exchange, and International Exposition of Mining Industries, etc. The advantages of the great world trade clearing house are obvious. Manufacturers will have their exhibits side by side, affording easy comparison. Interchange of ideas and the opportunity to observe what is new and improved in machinery, will be of decided benefit to all who are connected with the industry. Then, too, familiarity with the implements and machinery of one industry so often leads to appreciation of their applicability to another.

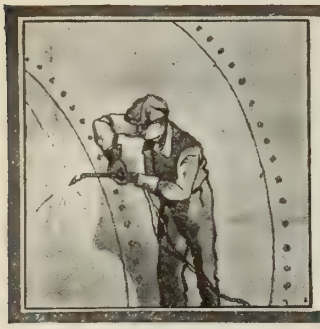
Lloyd L. Warfield is manager of the Machinery Exposition and will be assisted by an able staff. Fred W. Payne is general manager of the Merchants' and Manufacturers' Exchange, and has general supervision of all of the expositions. Inquiries should be addressed prior to Sept. 15th to Suite 421, 405 Lexington Ave., New York City, and after that date to Grand Central Palace.

Three fires started in a large grain elevator recently within 5 ft. of each other, at intervals of one hour. Experiments by electricians developed the fact that the fires were caused by wheat dust collecting on a 16 candle-power, 55-volt, ordinary incandescent lamp. The dust ignited from the heat from the globe, fell to the floor and ignited litter lying there. Further experiments showed that the defect may be entirely corrected by the installation of double globes, or, in other words, encasing an ordinary globe within a thin glass covering. This modifies sufficiently the intensity of the heat, but does not reduce the light.

Of the total output of crucible and electric steel in Germany, for 1917, 349,480 tons, 62 per cent. was produced in the electric furnace. One-third of this quantity was produced in induction furnaces and two-thirds in arc furnaces, the induction furnace apparently being preferred by the works producing high-quality steel. The average capacity of the electric furnaces built in Germany during the war was 6.7 tons. The figures for Austria-Hungary, which, much lower, show sensibly the same ratios, except that two-thirds of the electric output was obtained from induction furnaces.

As apprentices progress in their work they often find themselves in need of such tools as scales, micrometers, dividers, centering devices, and so on, but without the funds to provide them. One of the foremen in the Scovill Manufacturing Company's plant, realizing this, has adopted a method whereby these tools may be easily supplied. Each worker gives him 50 cents a week. As they at different times come in need of a certain tool, it is purchased with the money.

This instils in the boys the saving habit and helps them provide themselves with a set of high-grade tools.



WELDING AND CUTTING

Welding Jigs and How to Overcome Distortion

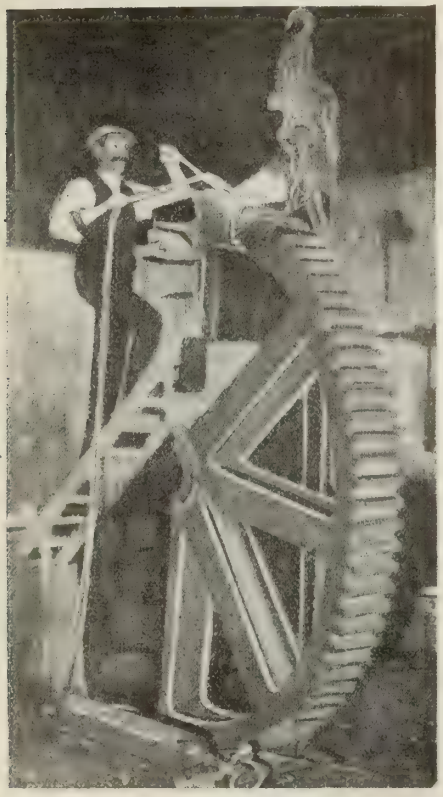
The Subject of Welding Jigs, and Various Methods for Overcoming Distortion as Presented by a Paper Read at a General Meeting of the British Acetylene and Welding Association

By C. S. MILNE

(Continued from August 14th Issue)

With regard to Mr. Metcalf's point concerning the rubber tubes in the machine in Fig. 31, these should not get entangled, as the machine is turned back to its original position after each cut; this unwinds the tubes again.

In reply to Mr. Pickett, Mr. Milne said: Much research into the welding of copper has been made recently. If one uses pure electrolytic copper one gets in the weld a large amount of copper oxide, due to oxidization during welding, but by using copper rod for filling in, which has a very small proportion of phosphorus in it, one eliminates the oxide and one gets a thoroughly sound joint. The great trouble is the large expansion of copper. Whether pure cupper or phosphor is used, it is very weak at high temperatures, and if you get any strain on it before it get down to a fairly low temperature, the weld or metal adjacent to the weld will crack as concentration takes place.



WELDING FRACTURE IN RIM OF CAST-IRON GEAR WHEEL TO TRANSMIT 240 H.P.

The only thing to do is to try to find some method of relieving the strains until it has cooled, but in most cases of repair work, particularly in flat surfaces, it is very nearly impossible to do that. Copper welds can be made, and are frequently made in new work, and, when one cuts through a section of them and makes a microscopical examination or analytical test, one finds the weld absolutely sound, the trouble is that copper has little strength while hot to stand contraction.

Mr. Gardner asked whether I made allowance for contraction in welding by means of my machine. Well, I did not. In this case (Fig. 29) there is a seam right round the article, and when you are welding it you have got to tack in a few places to hold it together. You may have trunnions to swing it on, but whatever you do it is impossible to make any allowance for contraction whether the work be done by hand or by machine. In the machine I intended to tack in three places to hold the parts together and the contraction would have had to look after itself. The bomb ends being more or less hemispherical in shape, would give somewhat to this contraction.

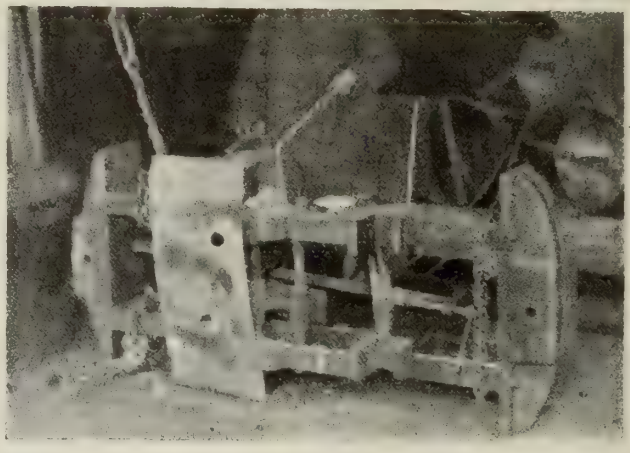


FIG. 35.

Mr. Hoddle asked whether my welding machine will be perfected. I do not suppose my bomb welding machine will ever be perfected, but I am hoping shortly to resume my investigations in regard to a machine which will be suitable for welding longitudinal or circumferential seams in such things as barrels and jacketted pans, etc., and I hope in six months time I shall be able to go to Mr. Hoddle and say I have got a machine to sell him.

Mr. Thomson remarked that I had not shown any examples of welding motor parts. I thought the motor side of this business had been done to death. If Mr. Thomson cares to come down to my works any day I shall be glad to show him anything from half a dozen to a couple of dozen cylinders in the process of repair. Our method of repairing a cracked cylinder head is to cut a piece

out of the jacket so that we can get at the head to weld and afterwards replace and re-weld the jacket, when cold we test it with water pressure; we then send it back to the owner as good as ever it was.

My thanks are due to our president, Mr. Jackson, for the great assistance he rendered in trimming up some of my sentences. I also wish to thank Mr. Hoddle for the kind loan of a lantern which was of great assistance in producing satisfactory slides.

The president in conclusion said: There is only one more word to be added, and that is to thank Mr. Milne for all that he has done and for all that we must have gained by out attention here to-night. I would just add that, as Mr. Milne is a member of the association, I shall not ask you to pass a formal vote of thanks, because he feels that he has only done his duty in giving us this information to-night.

The company then inspected the apparatus which Mr. Milne had brought for the benefit of the association.

Production Speed on Oxy-Acetylene Cutting

Here is an Answer to the Numerous Papers, Written on War Applications to the Oxy-Acetylene Process. This Was Presented at the Annual Convention of International Acetylene Association at New York

By R. R. BROWNING, Vice-President Oxweld Acetylene Co., Chicago

DURING the course of this victory convention, we have listened or will listen to a number of excellent papers on war applications of the oxy-acetylene welding process. These articles, as well as the large number which have appeared in trade papers, including our own official organ, "The Acetylene Journal," are of the greatest interest to those in the industry, proving, as they do, the wonderful development of the process in the field of production.

The majority of these articles deal principally with welding applications, and the very important part which oxy-acetylene cutting took in war work has been given little or no attention. This neglect is not intentional, but is due to the fact that oxy-acetylene cutting so naturally fitted into war production that even those who used it hardly gave it proper credit.

Business men in this country knew early in 1916 that production of war material would have to be speeded up to meet the demands of the Allies. This speeding up process was general throughout all essential industries, and the value of the oxy-acetylene cutting process, always in the first ranks as a time and money-saver, commenced to be recognized more thoroughly as a necessary part of the production system.

The demand for steel of all kinds to be used in shells, ships, guns, artillery, etc., became tremendous, with the logical result that scrap metal was required by thousands of tons. The use of the oxy-acetylene cutting process in wrecking old boilers, ships, tanks, etc., for steel scrap, increased to such a point that portable outfits were carried to most inaccessible places in country districts, the process applied, and charging box steel scrap produced for shipment to the mills. It truthfully can be stated that without the oxy-acetylene cutting process the scrap market would have been in an absolute panic to supply the tremendous tonnage demanded.

With the inauguration of submarine warfare by Germany, it became immediately apparent to the American shipbuilding industry that steel ships without number would be required. The oxy-acetylene cutting process, which since its introduction into this country has been used by the steel ship builder, was one of the first processes to be called upon to speed up production in old, as well as in new, shipyards. The development of the applications in the shipyards occasioned by the demand for more ships was a matter given special attention by the Welding Committee of the United States Emergency Fleet Corporation, by the American Bureau of Shipping and by Lloyd's. The result was the application of the process to such important work as the following:

Cutting or trimming of plates and structural iron to shape.

Making man-holes, portholes, patches, ventilator and funnel openings, stairway openings, mast openings and headlights.

Trimming stem and stern posts.

Cutting frames and "between rib" plates.

Cutting shafting, pipes, chains, rivets and scrap.

The majority of these applications were made absolutely essential during the war in the speed-up schedule required through the time limit placed on production, a most interesting example being that of cutting portholes.

It has always been customary in shipyards to punch a large number of holes with a ½ inch or ¾ inch punch around the periphery of the proposed porthole. The central portion or plate was in this manner removed and the edges then trimmed by means of a chipping hammer. An average of one and a half hours was required to make in this manner a 12 inch diameter porthole, whereas with an oxy-acetylene circular cutting blow pipe and a simple attachment, the portholes were, during the war, and are now, completed in an average time of five minutes each. This not only shows a considerable saving in time and cost in doing the work, but it can also be said that the finished porthole, as made by the oxy-acetylene cutting process, is better in appearance than that of the older process.

The process had been for years applied to the cutting of armor plate, but during the war the increased efficiency of heavy ordnance made it absolutely essential to increase the thickness of armor plate used on battleships and coast defenses. The oxy-acetylene process took care of this increased cutting limit in many instances in the manufacture of new armor plate. As a result of the change of armor plate construction made necessary by the war, Government proving grounds such as that conducted at Aberdeen, Md., were called upon to test, seemingly without limit, all kinds of armor plate. After this plate had been hit by several shells it was, of course, only suitable for further use as scrap. The question, however, was to reduce it to handling size, so that it could be remelted. A specific example of this can be quoted from work done at the Pittsburgh Crucible Steel Co., Midland, Pa., where thousands of tons of this scrap armor plate, averaging 16 to 17½ inches in thickness, was cut by the oxy-acetylene process. Working cost showed the actual cutting of this material at the very low figure of 1 3-10c per sq. in. and the wonderful speed of 3 lineal inches cut per minute. This speed is the more remarkable when one stops to consider the high percentage of chrome and nickel contained in armor plate.

Shortly after the United States took up arms against Germany, contracts were placed with numerous steel foundries throughout the country for castings to be used in the construction of naval and field guns. One of these castings, called the gun slide, is most difficult to manufacture. It has a trunnion or projection of metal on each side, which is very heavy compared to the walls of the casting and in order to eliminate shrinkage and cracking when the casting cools, the trunnion has to be carried clear across the casting. After the casting is cooled that part of the trunnion that passes the bore of the casting in which the gun rides has to be removed, and as the bore is circular, about 12 or 14 inches in diameter, varying with the size of the gun, to remove this part by machine would be very slow and costly, so that a number of foundries used to splendid advantage the Staybolt oxy-acetylene cutting blow pipe for removing the surplus metal. Such companies as the Superior Steel Casting Co., West Steel Casting Co., the Linderman Steel

Machinery Co., and the McCord Co., used the process, securing a good, smooth cut without injury to the walls. The time saving as compared with older methods was a tremendous factor in the speed of production.

Essential applications of the character already given might be continued without number, such as the application made by the Illinois Steel Co., of South Chicago, in cutting torpedo heads by means of the blow pipe, or of the work done by the Radiograph and the Oxygraph in cutting irregular steel shapes, but further remarks in the paper will be confined to what was probably the greatest example of the application of oxy-acetylene cutting made during the war, namely, the nicking of steel bars for the producing of shrapnel and high explosives or gas shell cases.

Long before the armistice was signed, many large plants in this country were engaged, in whole or part, in the making of shell cases, and the final overwhelming superiority of the Allies was undoubtedly due to the unlimited supply of artillery ammunition. It is a well-known army saying that "He who has the better artillery wins the battle," and especially was this true in the world war.

The United States Government had for some years made shells of various sizes in some of its arsenals, and, in addition, a few large steel companies, such as Bethlehem and Midvale, had ordnance departments previous to the war. When the appeals and orders from France, England, Russia, etc., commenced to reach the steel and forge men of America, a mighty upheaval took place. Large plants in all sections of the country turned from making bolts, nuts, air brakes, cans, machinery, etc., to the more urgent necessity, shells.

In the making of steel shell cases it had always been customary to take the long bars of shell steel as they come from the rolling mills, and by means of power driven saws, with teeth of high speed steel, cut them into billets or slugs so that the forging might then be made, the machining accomplished and the shell case assembled into the finished death carrying shrapnel.

Such companies as first entered into this new work during the years 1916 and 1917, for example, National Tube Co., McKeesport, Pa.; Bartlett-Hayward Co., Baltimore, Md.; Barney & Smith Co., Dayton, Ohio; Milton Mfg. Co., Milton, Pa.; Tennessee Coal Iron & Railroad Co., Birmingham, Alabama, realized immediately that if the tremendous production asked for was to be obtained that some other method of cutting bars and billets would have to be found which could be easily and quickly applied and which would be so fast that the big forging presses would not be idle a moment for lack of slugs.

Oxy-acetylene cutting just naturally filled the gap as no other method could, and the wonderful production figures as given below were attained in the majority of the hundred or more plants engaged in this work.

Hot saw or friction saw nicks gave

Diam. of bar. Inches.	Billets per 8-hour day per operator.	Average depth of nick.	Aver. cost per slug of nicking, including gases, labor and breaking.
3 2-10	2000	¼ inch	1.55 cents
5⅜	800	⅜ inch	4.8 cents
9	250	¾ inch	7.5 cents
11¼	100	1 inch	20 cents

only about one-quarter of these production figures, while the cost was more than double that of the oxy-acetylene method. It was also found that nicks made by the oxy-acetylene method doubled the number of good breaks as compared with that of the saw method. In addition, nicks made by means of saws did not break as close to the vertical plane or with as good a fracture as the bars nicked by the oxy-acetylene method. These two latter points were of special interest to the manufacturer, first because with the clean break the forgemen were enabled to place the billet directly into the die as it came from the breaking press or hammer and without difficulty centre the piercing punch, and secondly through the securing of a clean fracture inspection of the steel by Government employees was greatly facilitated.

When the process was first applied for the nicking of steel bars, the groove or nick was made to considerable depth and over the entire circumference of the bar. As time went by and the knowledge of experience was secured, the nicking depth was decreased and the cut was made usually over one-third of the circumference. No additional weight or power in the hammer or breaking press seemed to be necessary, and the breaks were even better than when the whole circumference had been nicked. The increase in speed and the decrease in costs were, of course, items of interest, especially to the larger manufacturers, where production of twenty-five to thirty thousand slugs per day was maintained as an average. Naturally various methods of holding the hand, or machine type, cutting torches used in this application were originated by the various users. Many of these devices were unique, but the majority were simple in character and made provision primarily for the holding and position adjustment of the blow pipe.

The majority of the installations consisted of Duplex Acetylene Generator, oxygen manifold, and the requisite number of hand or machine type cutting stations to give the production required.

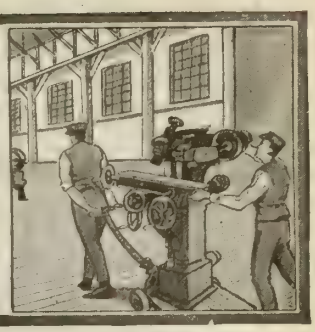
The process was also applied in some cases to the trimming of the shell edge after machining of the outer and inner surfaces, thereby increasing the speed of this operation as compared with the ordinary cutting off tool in the lathe by over 50 per cent. A similar application was also made of removing the nubbin or small end remaining at the nose of the shell case after machining in the lathe had been completed.

During 1917 and 1918 many large concerns took up the manufacture of shells, and practically without exception the oxy-acetylene nicking process was used to secure the large production demanded in their contracts. More prominent among those who did work of this character are the following:

New York Air Brake Co., Watertown, N. Y.
American Can Co., Edgewater, N.J.
American Steel Foundries, Chicago.
Milton Manufacturing Co., Milton, Pa.
National Tube Co., McKeesport, Pa.
Twin City Forge and Foundry Co., Stillwater, Minn.
Worthington Pump and Machine Co., Jeansville, Pa.
Pennsylvania Seaboard Steel Co., New Haven, Ct.
American Motor Truck Co., Newark, Ohio.
Bartlett-Hayward Co., Baltimore, Md.
Hewitt Steel Co., Newark, N.J.
Tennessee Coal, Iron and Railroad Co., Birmingham, Ala.
Cleveland Crane & Engineering Co., Wickliffe, Ohio.
Williams, White & Co., Moline, Ill.
American Rolling Mill Co., Middletown, Ohio.
William Wharton, Jr., Co., Easton, Pa.
Ingersoll-Rand Co., Phillipsburg, N.J.
Crucible Steel Co., Harrison, N.J.
Central Steel Co., Massillon, Ohio.
Detroit Steel Castings Co., Detroit, Mich.
Standard Forgings Co., Indiana Harbor, Mich.
Bethlehem Steel Co., Steelton, Pa.
Barney & Smith Co., Dayton, Ohio.
Curtis Manufacturing Co., St. Louis, Mo.
American Tube & Stamping Co., Bridgeport, Ct.
Laconia Car Works, Laconia, N.H.
E. W. Bliss & Co., Brooklyn, N.Y.

Reference has been made in this paper only to the application in production work, but we must not forget the thousands of applications which were made in the maintenance of plant equipment in conjunction with the oxy-acetylene welding process, thereby keeping producing equipment at top-notch speed. The further use of the process in such special applications as the cutting of steel lake steamers into two sections so that they might be passed through the Welland canal on their way to the ocean to do their bit in carrying the boys across to France, the application made by the English in removing sections of submarines or other vessels in order to allow the release of imprisoned persons, and it is further rumored that the Germans used the oxy-acetylene cutting process in the destroying of artillery which they had to leave behind in their flight. Can we not, therefore, in true justification, state that the oxy-acetylene cutting process must be, and is, recognized as one of the decisive factors in the winning of the war?

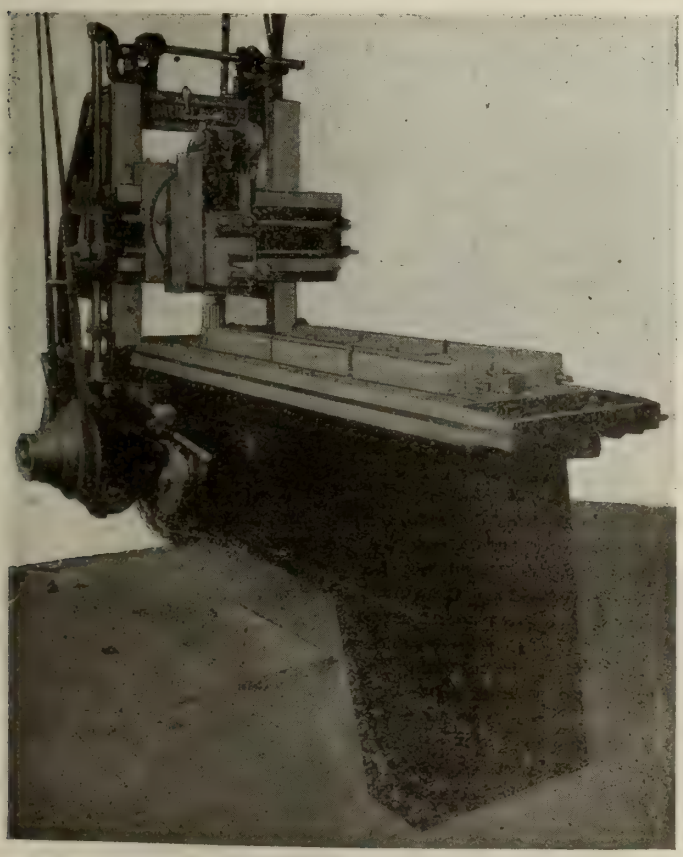
DEVELOPMENTS IN SHOP EQUIPMENT



MULTIPLEX MACHINE TOOL

FOR handling repair work in power plants, engine rooms, or on board ship, and to meet the requirements of general repair shops and garages, the Multiplex Tool Co., Inc., 76 S. Eighth St., Brooklyn, N. Y., has developed what is known as a "universal" machine tool which provides for the performance of those classes of work that are ordinarily performed on planers, lathes, horizontal and vertical boring machines, slotters, milling machines, drilling machines, and gear-cutting machines. From the accompanying illustrations, it will be apparent that so far as its general appearance goes, the design of this machine is more nearly like that of a planer than of any other standard tool. At the right-hand side, there is the usual planer driving mechanism, with forward and reverse belts and means of obtaining the required feed movement of the tool. As this part of the machine does not represent an important departure from standard practice in designing, the following description will be concerned chiefly with the mechanism at the left-hand side of the machine, from which power is taken for driving all of the different attachments that provide for performing the various operations on this machine. A detailed description will also be given of each of these attachments.

Before starting to give an explanation of the way in which the different members of this universal machine tool function, it will doubtless be desirable to make a general statement of means which are provided for the performance of lathe work, horizontal and vertical boring, milling, drilling, slotting, and gear-cutting operations. In order to do so, attention is first directed to the driving pulley at the left-hand side of the machine. From the shaft that carries this pulley, power is transmitted through bevel gears to a vertical shaft running up beside the housing. There are two bevel gears at the lower end of the vertical shaft, each of which meshes with a bevel gear on the pulley shaft. By means of lever on side of machine, provision is made for clutching either of these gears to the shaft in order to drive it in a forward or reverse direction. Through a pair of spiral gears, this vertical shaft transmits power to a horizontal splined shaft in the cross-rail, which transmits power through bevel gears to a vertical spindle mounted in bearings in the planer head. The small level shown provides for the manipulation of a clutch by means of which either of two bevel gears may be secured to the vertical spindle to provide for driving it in a forward or reverse direction. This vertical spindle is made with a tapered socket in which milling cutters or twist drills may be mounted, using an adapter bushing if necessary, or a gear furnished with a tapered shank to fit the socket may be mounted at the lower end of this spindle in order to provide means of driving the lathe head or the horizontal boring head.



ROUGHING OUT A SADDLE ON THIS MACHINE.

For the performance of slotting operations, a special attachment is permanently secured to the right-hand side of the planer head, power for driving this attachment being transmitted from the vertical spindle through a pair of spiral gears to a horizontal shaft that carries a slotted crank disk, in which the position of the crankpin may be adjusted to provide for obtaining any required length of stroke for the slotting tool. For vertical boring, a rotary work-table is provided, which is driven from a spiral gear that can be seen on the vertical driving shaft at the left-hand side of the machine. From this gear, power is transmitted through a horizontal shaft that is carried by a bracket bolted to the face of the housing, and thence through bevel gears to another horizontal shaft on which there is a worm that meshes with a worm-wheel connected to the rotary table. It will, of course, be apparent that in connection with this rotary attachment, use is made of a tool mounted in either the vertical spindle or clapper-box of the planer head, according to which is most convenient for the particular job on which the machine is engaged.

Lathe Headstock and Tailstock

The lathe head is driven by a bevel pinion carried on a tapered shank which fits into the vertical spindle of the machine. This pinion meshes with a bevel gear on the lathe head, and it will be seen that back-gears are furnished, as in the case of engine lathe heads of standard design. There are also studs at the end of the head on which the necessary combinations of change-gears may be mounted to provide for the performance of a wide range of thread cutting operations. Such operations are handled with the work mounted on centres; and to provide for traversing the tool along the work, use is made of a combination cross-slide and longitudinal slide that is mounted on the main table of the machine between the headstock and tailstock. Longitudinal movement of this slide is

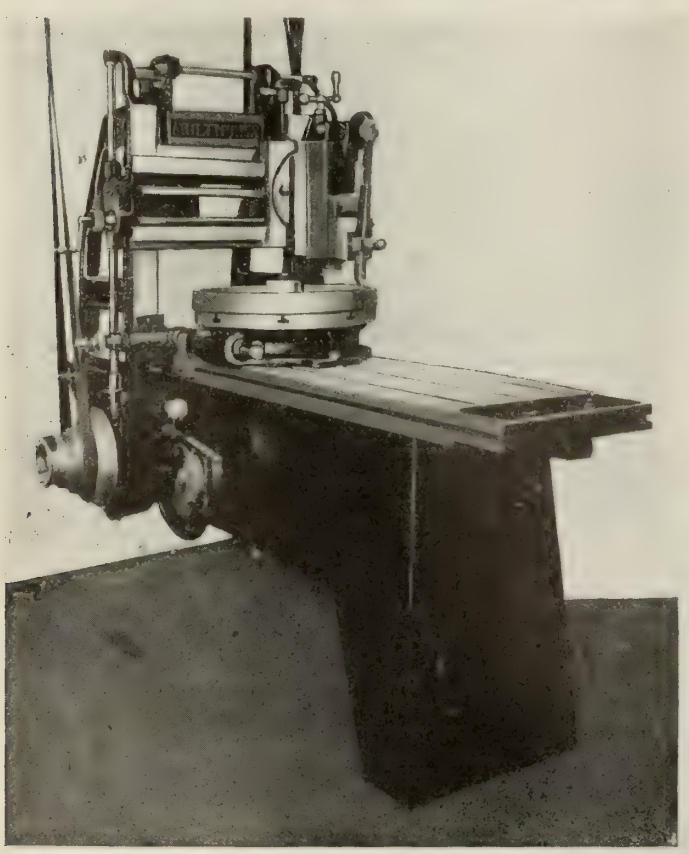
accomplished by means of a lead-screw which is rotated from the lathe head by means of a universal pointed rod.

In addition to its use for thread cutting, the lathe attachment can be utilized for the performance of various turning and facing operations; also, there is a dividing head mounted on this attachment which provides for the performance of gear-cutting operations and for such work as milling the sides of hexagonal and similarly shaped pieces. Almost any work for which a dividing head would ordinarily be employed can be done on this attachment. For gear cutting, the blank is chucked on the lathe into the tapered socket of the machine spindle. Then the traverse movement of the planer table is used to feed the work past the cutter. When the cut has been taken, the table is returned to the starting point and the work is indexed, using the dividing head to obtain the necessary spacing, after which a second tooth is cut. This process is repeated until all of the teeth have been completed.

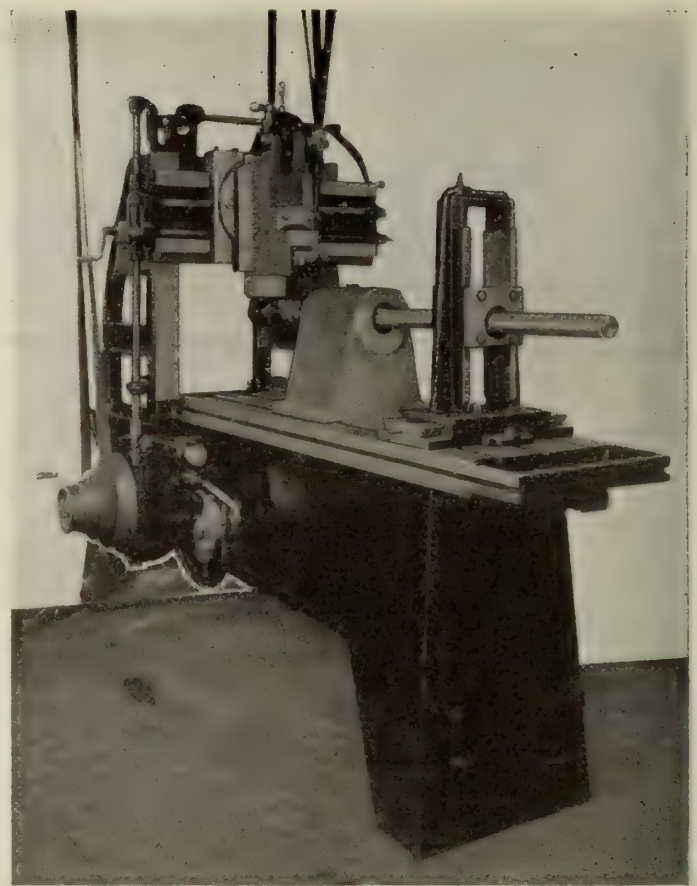
Horizontal and Vertical Boring Operations

For use in performing horizontal boring operations, there is an auxiliary attachment which is bolted onto the bottom of the planer head, provision being made for driving the horizontal spindle of the boring attachment by means of a bevel pinion carried by a shank which is fitted into the socket of the spindle carried by the planer head. This pinion meshes with a bevel gear on the horizontal spindle of the boring attachment, in which any required form of boring-bar, twist drill, or other tool may be mounted. Where a boring-bar of considerable length is to be utilized, an out-board support must be provided, and on the Multiplex machine this is furnished by a steadyrest having a bearing of the proper size to receive the outer end of the boring-bar.

In the kind of shops where the Multiplex machine is likely to be used, it will frequently be found necessary to handle such work as boring out a bearing and facing both ends of the bearing housing at accurate right angles with the bore. Such work may be done very nicely by means of this horizontal boring attachment. After the bore has been finished, a facing tool is mounted in the horizontal spindle and one end of the work is faced off. In order to assure having both of the end faces at accurate right angles with the bore, care must be taken not to disturb the setting of the work until the job is finished. Hence, the method of procedure is to raise the cross-rail and run the planer table through to a position where the opposite end of the work can be reached. Then the horizontal boring attachment is reversed, end for end, to enable the facing tool to complete the job by finishing the opposite end of the casting.



HORIZONTAL TURNING—FINISHING A GEAR BLANK ON ITS OUTSIDE DIAMETER.



HORIZONTAL BORING—NOTE THE TABLE IS FEEDING AGAINST THE CUTTER.

Vertical boring operations are performed on the Multiplex machine through the use of a rotary table on which the work is carried. The means that have been provided for driving this attachment have already been described. The rotary table may be used for the performance of vertical boring operations done with a tool carried by the clapper-box, or use may be made of an end-mill mounted in the main spindle of the machine. Ingenious mechanics will find many ways of using this equipment for handling the great variety of work that comes to the average jobbing shop, for the performance of which several different machine tools would otherwise be required.

Milling and Drilling Operations

Either milling or drilling operations are performed with an end-mill or twist drill mounted in the main spindle carried by the planer head. An important feature of the design, in so far as the performance of these two classes of operation is concerned, is that the planer head is mounted on a gradual swivel so that the spindle carried by it may be set at any required angle for performing milling or drilling operations in other than a vertical position. Any point can be reached around a complete circle. Power cross-fed and longitudinal feed movements are provided for the performance of milling operations; the transverse feed is accomplished by means of a screw in the cross-rail of the machine, which traverses the head along the rail; and for the longitudinal feed movement, the bull wheel and rack are driven at a slow speed in order to

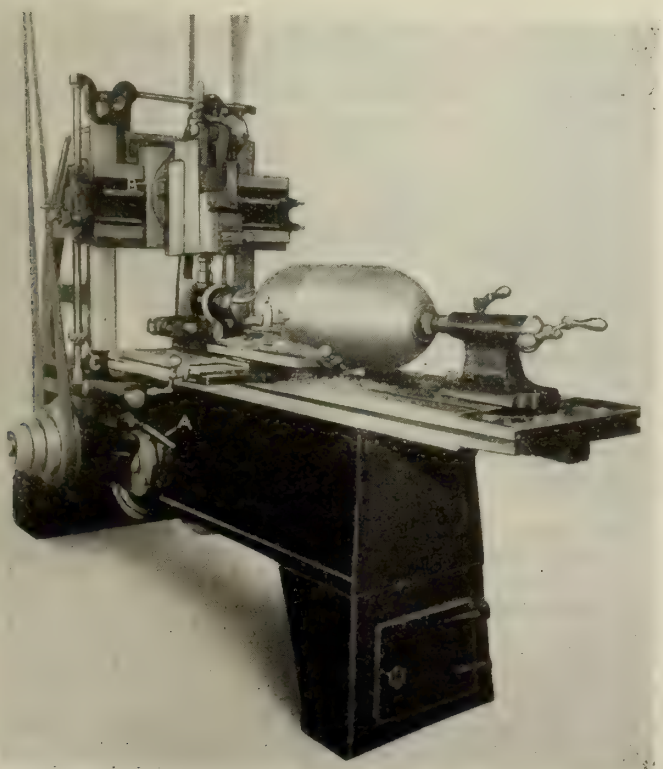
feed the table along the bed of the machine at the proper rate. This feed movement is obtained by driving the bull wheel at a low speed through a universal jointed rod, which takes power from the driving pulley at the left-hand side of the machine. On both the longitudinal feed and cross-feed movements, friction clutches are provided, and if so desired, these clutches may be released by simply turning a knurled sleeve, after which a hand-crank may be used for obtaining a rapid traverse or quick adjustment, according to the conditions of operation that are needed.

Slotting Attachment

A description has already been given of the arrangement of the slotting attachment, but attention should be drawn to the fact that the graduated swivel, on which the main head of the machine is mounted, provides for swiveling the slotting attachment so that it may be used for cutting die openings to obtain the required clearance, or for the performance of keyseating or slotting operations in tapered openings, etc.

Adaptability

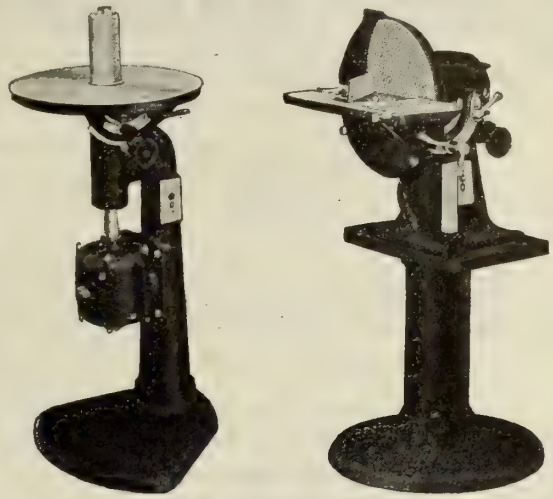
With a machine of this type, there are very few among the great variety of shops which come to a shop engaged in the performance of general machine work, which cannot be handled; and it will be of interest to note in this connection, that any of the attachments provided for use on this machine can be set up in not over fifteen minutes. One of the most important claims made for this Multiplex machine tool is that it is able to handle all of the operations which have been mentioned, without occupying any more than would be required to set up a small-sized planer. Any combination of operations can be performed on a piece of work without requiring its setting on the tables to be altered. This is often an important feature in assuring accuracy in combination boring and facing operations, etc.



TURNING BRASS STUDS ON AN 11-INCH MORTAR SHELL.

SANDERS NOW MADE IN CANADA

THE Canadian Sander Mfg. Co. have equipped a plant at Brockville, Ont., for the production of disc and spindle sanders, they having secured the Canadian rights of the Syracuse Sander Co. Plans have been made to cover the Canadian market thoroughly with these maximum time-savers. The field not only includes pattern



SPINDLE AND DISC SANDERS.

shops but woodworking concerns of all kinds and those institutions where instruction is given in pattern-making and woodworking.

The Sanders are portable, have direct motor drive and are equipped with ball bearings. They are guaranteed for one year against electrical and mechanical defects, can be plugged into any lamp socket and are very easily moved about in the shop. The disc sander has a 15″ disc, table 8″ x 20″; table is 38″ from the floor, tilts 45 degrees downward and 15 degrees upward; weight, 350 pounds; speed, 1,725 revolutions per minute. A vacuum system collects 90% of the dust. The same description applies to the spindle sander. The table is 20″ in diameter, there is absolutely no vibration, weight 200 pounds; oscillating movement 1⅛″; rolls 2″ x 9″ and 3″ x 9″. The equipment of the disc sander includes one motor, one extra metal disc, six garnet discs, half gallon cement, gauges, and six centre points. The spindle machine equipment includes a motor, two rolls and a half gallon of cement.

The plant at Brockville is located in the building formerly occupied by the McArthur Belting Co., the latter having recently moved to the Halls, Limited, building.

Motor vehicles are used extensively for war purposes, but they have not entirely displaced horses. According to a statement by the British Premier, Lloyd George, the British alone employ 2,000,000 horses in their armies. 5,000,000 horses and mules are in service on the West front. Many a ship-load of mules and horses has gone from this side across the "pond" to the allies in France and England.

During their recent raids on Paris the German aviators were greatly disconcerted by rockets which the French sent up and which discharged, before dropping, parachutes with brightly burning fuses. These parachutes dropped slowly and their fuses cast a brilliant glare upon the hostile airplanes, making them a good target for the anti-aircraft guns. It is a safe guess that the free fireworks were not enjoyed by the Germans.

OUR readers, and particularly those personally acquainted with Col. J. B. Maclean, President of the Maclean Publishing Co., will learn with deep regret and heartfelt sympathy of the sudden death on August 17, of his son and only child Hector, aged sixteen years.

Hector was on a camping trip with Upper Canada College boys and was taken suddenly ill with acute indigestion. He was rushed in to Temiskaming, where medical attention was secured, but they were unable to save his life.

The Exchange Rate

THE why and the wherefore of the exchange rate on money passing from this country to United States, or the other way, is not clearly understood by many. As far as this country is concerned, it simply means that we have bought too much from United States, in proportion to our sales to them, and the balance is enormously against us.

But apart from that the thing is being abused, and it does not work out fairly even in this country. In the larger centres, where banks are plentiful and easy of access, the exchange rate can be secured for any American money that one may have. There are other places, though, where dealers regard American money as not one whit better than Canadian, especially when it is coming their way, although it is worthy of notice that very seldom does any of the American currency get handed out in the way of change.

United States is not in an enviable position by reason of the rate of exchange which it is able to declare against the money of the world. The Italian lire, the French franc, the British pound sterling, the Canadian dollar—they have all been discounted and set back severely in United States markets. It simply means that the purchasing power of all this currency is severely discriminated against in the U.S. markets. There is nothing new or startling in the situation, as history will show, if one cares to go back a few years to the American Civil War, that their dollar on this side of the line was regarded as being worth only sixty cents, a discount more severe than has been put on the currency of any Allied country in the markets of United States.

The rapidity with which the exchange rate changes is something that causes no small amount of worry. For instance, one day the British pound, which should be worth $4.86⅝, brings in New York $4.19¾, while on the very next day it is slated at $4.12¼.

The most natural thing in the world is that the nations whose money is at a discount should seek to avoid making any more purchases than they can help in the market where the discount exists. Nations are the same as individuals, and that is the course the individual would pursue. Were he to find that his dollar was being pruned by five cents at a certain store he would look elsewhere, and he would buy at that store only when circumstances made it necessary that he should do so. That is the very thing that is happening in United States. Their exports are falling off, and as the rate of exchange becomes more severe, or even sustained, they will continue to fall off. It certainly is not to the advantage of United States to have the purchasing medium of its customers at a discount and it is a condition that, in the long run, hurts many and benefits few.

There should be no barrier in the way of adjusting this matter. It is the veriest nonsense to tell us that a Canadian dollar, because it is spent in New York, is only worth 95 cents, and there are plenty of places where they will credit only 90 cents against it. That Canadian dollar has security behind it second to none. Likewise it is fallacy to say that a British pound is worth only some $4.12 or $4.19, as the fluctuations of the day may indicate. A British pound is worth $4.86⅝, no matter whether it is offered as payment in New York, London or Toronto. It has value behind it, and it is tough business that it should be discounted because the British nation was up to its neck in fighting the battles of the world, and had to import and import to keep going, regardless of any such puny peace-time matters as balance of trade.

The Governments of the Allied countries should get together on this matter and straighten it out. It is to the benefit of United States that it should be done, and done quickly. The exchange drives trade away. It does not attract it.

THE peace treaty having been duly signed, the anti-Bolshevik forces have proceeded to boot the Bolshevik out of Odessa.

SPEAKING of hardy perennials and annuals of all sorts, the chap who bobs up each year at the fall fair to guess your weight within three pounds easily heads the list.

* * *

THE German mark is so severely discounted now that it pays European firms handsomely to do their purchasing in Germany. In other words, they can make quite a big mark with the little German mark.

* * *

THE Prince of Wales, while in Toronto for a couple of days, shook hands with some 4,000 people, attended 'steen banquets and about 17 other functions. He had to smile under all sorts of conditions, stand when any person would want to sit, and be cheerful to prunes and good fellows alike. To say the least that's not our idea of having a real honest-to-goodness pleasant time.

* * *

CARUSO has an offer to go and sing in Mexico at $10,000 per night. Without going to the extent of disclosing names we know of several folks who will holler themselves hoarse for a whole month for that figure.

Upward Trend of Steel

ACCORDING to reports reaching here from the steel centres of United States there is a serious situation facing that industry just now. It is not that they have no business or poor bookings. The very reverse is the condition. They have a tremendous amount of business on hand. In some lines the mills have practically withdrawn from the market, as they have more on their books than they can handle.

Labor trouble has not hurt the steel industry of United States very much this year. We may have imagined that all the labor trouble there was on this continent had camped in the cities of Canada, particularly Winnipeg and Toronto, and so far this is probably fairly correct.

Labor troubles threaten to grip the steel industry now in an effort to unionize it, a feat which has heretofore been unsuccessful, although several times attempted. Such a step will touch practically the whole steel industry of United States.

Were this to happen it would mean an almost instantaneous shutting off of certain supplies as the warehouses are not heavily stocked in many places. It would also result undoubtedly in a stiffening of prices because there would be only a very limited supply of material to go around a great many pressing calls.

It is hard to see where lower levels of steel can be looked for at present. Indications are in the opposite direction. This paper is not an apostle or an advocate of higher values, but there are circumstances now that seem to point to higher steel prices before very long. Right in this province there are indications of this. One contract for bars was offered to the rollers at their old price, and it was a nice straight run in good lengths, but the mills turned it down, being booked up and not at all anxious for more business at present figures. Warehouses in several cases are in the market replenishing stocks, doing so because they have figured it out that buying now is good business, and they are out to protect themselves as well as their trade.

The Value of the Exhibition

TORONTO Exhibition has grown well and grown largely, but that building decorated with the name "Machinery Hall" has not grown along with the rest of the institution. It is now as it has been for many years.

It is not an easy matter to get a showing that will be representative of Canadian industry in the mechanical world. Much of the most interesting machinery is heavy and difficult to transport, and it is not an easy matter to get it erected and in operation to the best advantage.

There are many lines of machinery also that have nothing but a spectacular or passing interest for those who flock to the exhibition. Makers of machine tools, for instance, do not sell to the crowd. It may be very interesting and gratifying for them to have a big crowd around watching their machinery in operation, but that is not nearly as satisfactory to the business office of the firm as getting two or three real prospects in the corner and talking brass tacks to them for half an hour. There may be tens of thousands of spectators and never a single purchaser or prospect for a future sale.

The firm that benefits most is one having something of popular interest and appeal for sale. A fair of this sort is a great place to show the fine points of a washing machine, electrical goods, etc. There are thousands of interested spectators for the demonstrations that may be given, and in that number there are thousands of prospective purchasers. The same can be said of firms that have machinery on exhibition that has a special appeal to the agriculturist. The farmer is a good buyer just now. He already leads the automobile procession. He has the money and he is, through force of circumstances, and a desire to advance, going in for the purchase of farm machinery that will make him less dependent on farm help.

For these reasons and others it is a difficult matter to get together an exhibition that would be thoroughly representative of Canadian machine tool trade. Those that are exhibiting have done well, although the exhibits are not by any means limited to Canadian products. The present premises are not such as will bring out the best exhibits. They are cramped, none too well lighted, and the space available is too limited.

The Way of the World

"All our straw hats marked away down. $3 hats to go for $1 in this clearing out sale."—Advertisement.

Of all the things that make me sick, and turn me boilin' mad. and make my countenance and purse alike feel flat and sad, it is to read such things as this—I feel most awful mean to think my joyous braided hat is only worth one bean.

It's only just a month ago I tried to make a splash, and peeled three legal dollar bills from off my scanty cash.

And when I donned that three bone lid I felt just like a sport, or like a fashion plate that walks on Broadway in New York. But every gump that meets me now, and every ragged kid, will make a nasty face and snort: "Oh you one dollar lid!"

The old hat was a fearful thing, it was a sight to see—it looked as though it had been worn way back in '93. But even so it makes me sick, it gives my brow a pain to think of those two worthy beans I breezed away in vain.

But every dog has had his day, and so has every hat, the trouble comes when these here things don't know just when to scat.

You may be worth a pile to-day, with money in the bank, you may have quit the common clay and be a man of rank. But your time comes, and out you go with dull and sickening plunk, to camp with other has beens upon the pile of junk.—ARK.

MARKET DEVELOPMENTS

What Will Happen In The U.S. Steel Market?

Strike Shadow Causes Some Uneasiness, And Buyers Cannot Secure Definite Promises at U.S. Mills—Extensive Selling of Agricultural Machinery is Reported to Have Taken Place

NOT so very many weeks ago buyers were hesitating about going into the steel market to make purchases for future needs in large quantities. They preferred to buy for actual requirements, and to pay warehouse rather than mill prices for what they secured. Now the chances are that a large buyer would find it very difficult to get a mill to give him anything like a definite delivery promise. The uncertainty that exists regarding the labor situation in United States, especially as it centres around the steel mills, is having the effect of stimulating purchases in many lines, on the assumption that it may be hard to get supplies later on should the strike fever break out, as it threatens to do.

Canadian mills are well booked in some departments, and although no price changes have been made, there is a very plain intimation that bar mills will have new figures for the trade before very long. These mills have a lot of business now, and are not keen to book in some cases at prevailing lists.

Buying is quite general in plates, tubes, etc. In fact so urgent has been the call for plate in some cases that warehouse prices have been paid for tonnages that under ordinary circumstances would have gone to the mills. Delivery from the mills is not improving, this being especially true of the boiler tube situation where there is considerable spread now between the time of order and that of delivery.

The automobile business is still a good purchaser of machine tools, and other interests that have contracts from these firms are also buying. Dealers handling agricultural machinery report heavy sales. In fact one large distributing firm reported this week that they had sold their allotment of tractors already, including those that had been counted on to keep their sales force busy right up to the end of the year.

Scrap metal shippers are not selling very heavily, unless under contract, there being a feeling that it is good policy to wait until the New York and Chicago markets settle down. There seems to be a feeling that manipulation is going on in some centres, and holders of good qualities are simply letting matters stand. Prices remain stationary.

MONTREAL FEELS EFFECTS OF THE LABOR AGITATION IN THE STATES

Special to CANADIAN MACHINERY.

MONTREAL, Que., August 26.—While industry in this district is comparatively free from labor troubles, the situation, nevertheless, is more or less dominated by the developments in the States, as the market here is virtually a reflection of American conditions; this is characteristic of the steel trade, and until the general unrest has been removed the market here will naturally be influenced in no small degree by American conditions. Nothing is definitely known as to the possible attitude of the producers should labor force their hand, but, in the opinion of some dealers here, it would not be surprising if some of the mills were closed indefinitely. The policy of the mills in declining extensive orders for future delivery is a feature that emphasizes the serious possibilities that may arise within the next month or so. Steel trading in this district is not what might be called active nor can it be said that business is dull, as there is a steady though light demand for many classes of material. Some good trading has been done in light structurals. There is hardly any exception to the general rule of conservative buying as consumers are reluctant to purchase far beyond their immediate requirements. This attitude will probably continue throughout the year, and until such time as the prevailing unrest affects the market and general reconstruction. Non-ferrous metals are firm locally but show strength in the States. Machine tool business is light but steady. Iron and steel scraps are weak while old metals are taking on strength.

Metals Firm on Steady Demand

Little change is reported in the local situation and the demand continues steady but of comparatively light volume. There is an upward movement of metals in the States, but the strength has not, as yet, influenced the market here although there is a prospect of advances before the beginning of the month. Brass interests are steady buyers but just in sufficient quantities to satisfy present needs. Tin is moving freely at 60 cents per pound. Lead is in better demand and local prices have advanced ¼ of a cent, the quotation being 7½ cents per pound. Local dealers are quoting antimony at 10 cents, a decline of ¼ cent. on the week.

Higher Cost on Delayed Delivery

Little disposition is shown on the part of users of machine tools to buy in other than single or small quantities, but the volume of business done in this way is considerable and of a fairly steady character. No class of equipment is favored and apparently the business is widely distributed. A factor that adds to the difficulties of the dealer is the fact that price quotations are far from stationary, and where delays arise after a quotation has been made there is a likelihood that an advance may be made before the actual order will be placed. Another factor is the exchange rate when tools are brought in from the States. On extended delivery there is a great possibility that the ultimate cost of a machine will exceed the estimate made at the time the order was placed.

As stated by a dealer here, the duty charged is based on the price of the machine at the time of shipment, so that when an advance is made by the manufacturer, the added duty must be shouldered by the dealer, or some arrangement made between the dealer and the customer. There appears to be a tendency on the part of the Canadian manufacturer to follow in the wake of the American manufacturer and mark up his quotations so that they are slightly lower than what a customer could obtain a similar machine—for from the other side, and the result in many cases is that the American manufacturer gets the business. In spite of the steadily-increasing costs, however, the present inquiry is good and no falling off in general business is reported; in some instances the month's turnover has shown a slight increase.

Non-Ferrous Scraps Firmer

The disturbances that are prevalent throughout the steel producing industries in the States have had the effect of considerably curtailing the trading in old materials, especially iron and steel scraps, and in consequence the market here has felt the reaction that has taken place across the line. The interest of large consumers has fallen off considerably and dealers are awaiting further developments in the steel industry. The result of these conditions is shown in the quiet tone of the current market. Sales are very light but dealers are holding to last week's quotations, although the weaker tendency may influence prices before the week closes. The old non-ferrous metal situation is brighter and the increased strength of the metal market is reflected in advances in some of the scraps. Old coppers have been advanced 1 cent per pound, and in general the prices on all other metals are firm.

POINTS IN WEEK'S MARKETING NOTES

Labor troubles threaten to break out in the effort to unionize the steel industry in the United States.

—

Warehouses in many cases are buying now, looking for firmer prices in the near future in several lines.

—

Large sales are being made, especially in plate, some shipments being large enough to rank as fair-sized mill orders.

—

The report, published in these columns several weeks ago, of a ten per cent. reduction in the price of high speed and carbon drills, was not correct. The information was given to CANADIAN MACHINERY in good faith and published in the same way.

—

Large dealers in scrap material are not shipping, except on contract, until affairs in the U.S.A. markets become more settled. Prices, though, are firm.

—

The low value of the German mark at present makes it profitable to do business with that country, and U.S. machine tool builders believe it is keeping them from securing many European orders.

—

At present it costs a French firm $1.60 to buy a dollars' worth in New York.

GOOD BUSINESS IS COMING IN NOW

Dealers in Many Lines are Outspoken Regarding What They Are Securing Now

TORONTO.—There can be no doubt about the good business that is being done in every line, from machine tools' salesmen right through the lists to the warehousing interests. Buying is not restricted to any particular line, and in this, one finds good news. Purchasing is becoming quite general. Dealers also add that there is less of a tendency now to look out for used equipment, as in many cases the specifications now are for new goods entirely.

As far as the buying of machinery is concerned, the automobile business is furnishing the bulk of the business, and this is likely to develop in more ways than one. For instance, the building of a large plant for the General Motors at Walkerville is opening up several accounts for material that have been closed for some time.

"CANADIAN MACHINERY" several weeks ago published an item stating that there had been a ten per cent. reduction in the price of high speed and carbon drills, on the part of the makers. We have since been informed that this information is not correct, although it was given to this paper in good faith in the first place, and accepted as such.

Big Orders Placed

"The best two weeks of the year" was the way one of the largest warehousing interests sized up the business of the past fortnight, when discussing the market situation with CANADIAN MACHINERY this morning. This firm has a pretty warehouse in some lines as the result of heavy buying that has been going on. The demand for some of the lines has been urgent, plate being one of them. To show the business that is being done it might be mentioned that one firm took a shipment of forty tons from a warehouse stock, not being able to wait for mill shipment. Of course, the warehouse price is a stiffer one than mill shipment, but in this case it was delivery that was wanted and paid for.

Warehouses are buying quite heavily in some cases although in others they have not cleared out the large war stock that was being carried. One of the dealers stated this morning: "We are buying heavily now, because we confidently expect that prices are going up to a higher level than they are at present. There are labor troubles of several kinds on the horizon in the steel mills district, and these, along with other tendencies, are going to keep prices up. We regard it as a good policy on our part to buy enough now to put us in good shape for some weeks and months to come.

The Trend of Prices

If one doubts the fact that prices are headed upward, it is not hard to produce evidence. For instance, there was one order out this week for a large amount of bars for bridge work, the whole lot amounting to some 186 tons. The order was offered to one of the mills that usually has a pretty fair bar capacity, and it was thought that it was a very acceptable piece of business, as there was a section of 125 tons of ¾ roun in long strips, which would make a nice long run. However, the mills turned the business down flat at the market price, stating that they did not care whether they booked any more bars for six weeks, and that the price on this line was going to go higher. That seems to be the feeling in several centres, but so far there have been no definite increases announced to the jobbers. Prices from the warehouses are, therefore, just where they have been quoted for some time back.

Plate and tubes generally go pretty much hand in hand, and they are both moving out rapidly at present. Some of the larger boiler shops are very busy indeed, and are filled with work that will run on for some months to come. There is a nice large job, likely let by now, by some of the large Northern Ontario firms, that will call for a large amount of steel construction work. Tubes are not easy to get, dealers being advised by the mills that there is a shortage of skelp. Whatever the reason, it is a fact that deliveries are poor, and shipments are made on two months instead of two weeks in many cases.

The British Goods

Reference has been made in these columns before of the efforts that are being made to get British goods on the market again, and of the small success that is being met with. There is another case just now, and it will be rather interesting to watch developments and see what comes of it. One of the Ontario shipbuilding firms has a contract now, on which it is desired, for several reasons, to use British material as much as possible. The firm sent to several dealers in Toronto asking for quotations in British goods, especially chains and anchor. Reply was made that it was almost impossible to get a straight bid from British firms now, as their figures were filled with so many clauses regarding labor troubles and strikes, shipment, etc., that they could hardly be considered as a real bid. So the firm forwarded

a definite quotation from a U.S. concern and let it go at that. The shipbuilding people came back immediately asking for a quotation on the British goods, stating that they would be prepared to wait for six months for delivery. So there is a demand for the British made goods, if they can be supplied. The trouble is in many cases that they are not to be had.

The Machinery Market

There is a lot of business moving in the machine tool market. The same can be said of the motor market. Wood working machinery is also very brisk. The automobile business is doing a lot of buying now, and the firms that have contracts from that line are also in the market. Dealers handling agricultural machinery are doing in some cases a land office sort of business. One of the largest distributors stated to CANADIAN MACHINERY this morning that they had cleared out entirely their line of tractors already, including all that they had reckoned would be sold between now and the end of the year. They are having some more rushed along in order to make a showing at the Toronto fair this week. They had thought previously that they were booking plenty to hold their sales force for the entire year, but they are away out on their count.

There are some nice queries coming into the market now, especially for tool room stuff, and in nearly every case there are new machines being placed. Dealers find trouble increasing in securing anything like good deliveries, as the firms making machines that are much wanted are sold right up, and shipments come direct from factory.

The Scrap Metal Market

There is a feeling of doubt in the minds of some of the large dealers in scrap metals as to what the next move is going to be. There seems to be an impression that there is some manipulation going on in the larger consuming and buying centres, and until this is dispelled it is likely that there will be a tendency on the part of some of the larger dealers in Canada to sit tight. It may be that there will be a slight dip in values, but it is hard to see where it can last for any length of time. It is claimed by several that tho coppers and steel have reached their peak for some time at least, and that they are not due for much higher figures. However, there is no feeling that they will travel far in the opposite direction. Some of the smaller sellers feel that right now is a good time to sell their material, and they are still letting it go, particularly as the buyers here and in Montreal are standing behind the prices that have been ruling for some weeks past, and it hardly seems likely, unless something unforeseen happens, that there will be any reduction in buying values.

NEW YORK MARKET FINDS THAT EXCHANGE RATE IS HURTING TRADE

Special to CANADIAN MACHINERY.

NEW YORK, August 28.—There are indications that a considerable business in machine tools could be done with some of the European countries if it were not for the unfavorable rate of exchange. Moreover, this situation is playing right into Germany's hands, as the low value of the mark makes it extremely profitable for European countries to do business with Germany. Even France and Belgium may be forced, in self-protection, to buy German rather than American machine tools. To buy one dollar's worth in the United States requires the equivalent of $1.60 in French francs, and France certainly cannot pay such a premium for the privilege of buying here, except such things as she cannot procure elsewhere.

An inquiry for more than 400 machine tools for a complete automobile plant to be built in Sweden is being figured on by American tool builders, but here also the exchange rate operates against the orders coming to the United States. It is understood that the company prefers American tools, but may be forced to buy British or German make.

The Finnish state railways want about $50,000 worth of tools from the United States, but there is no international exchange between the two countries, so the business probably will go to England, which is buying Finland's dairy products.

The matter of credits is also an obstacle in the placing of foreign machine-tool orders here. Poland, for example, recently bought 150 locomotives from the Baldwin locomotive works and now wants 200 machine tools for a locomotive repair shop. In the case of the locomotives, the Baldwin Company arranged its own financing, and it seems probable that it will also equip a repair shop for Poland's railways, inasmuch as private banking interests are loath to grant the desired credits.

Japan in Favor

Japan is about the only important foreign buyer of American tools that can buy here on favorable terms. Considerable business has been closed with that country, and inquiries now in the market for equipping shipyards and other plants aggregate several hundred thousand dollars.

Expansion of the automobile industry continues, and two eastern "war plants" have passed into the hands of leading automobile concerns. The plant of the International Arms and Fuse Co., Bloomfield, N.J., has been sold to the General Motors Corporation, and the plant of the Duesenberg Motors Corporation, Elizabeth, N.J., has been acquired by the new Willys Corporation, which will use it for the manufacture of six cylinder motors for the new Willys car. The International plant was used during the war for the making of shells, fuses, etc. Practically all of its machine-tool equipment has recently been sold.

Domestic buying is fairly quiet, but this is not surprising as August usually is a dull month.

The Baldwin Locomotive Works, Philadelphia, has placed an order with the Niles-Bement-Pond Co. for 16 overhead cranes, eight of 20-ton and eight of 10-ton capacity. A small list of tools also was bought, all of this equipment being for a new cylinder shop at Eddystone, Pa.

MORE STACKS BLOWN IN

There is still a very good demand for pig iron although the sales are smaller than last week's. Prices remain firm with a tendency to increase, and more stacks are being blown in. Reports from United States points follow:

Philadelphia.—Quite a bit of 1920 first quarter business has been booked, although prices for this delivery are quoted $2 to $3 above present prices. Some foundry iron of the 2X grade has been sold at $28.50, but many makers look on $29 as the minimum for this grade. Basic is not active, but there is good enquiry for foundry iron for last and first-quarter delivery.

Boston.—Furnaces here are receiving small orders for last-quarter delivery, but no one seems to be anxious for first-quarter orders. The aggregate of the sales for last week was only 4,500 tons, which is one of the lowest, if not the lowest for the last two months.

New York.—Some foundry iron for the first half has been sold here at a price about $2 better than iron for this year's delivery can bring. The total of sales amounted to about 10,000 tons, and the market is strong. There is some good enquiry for export business, including 4,000 to 5,000 tons basic for England and Italy.

Pittsburgh.—The market in this district is pretty well sold up, and with the decreasing demand there is less talk of higher prices. Two stacks have been blown in, and two more are expected to be lighted during the next two weeks. There is an enquiry for from 5,000 to 10,000 tons basic not yet covered, but otherwise steel foundries are pretty well stocked up.

Buffalo.—With two makers out of the market, business has been pretty good during the week. One maker booked an order for 10,000 tons foundry iron, which about filed their capacity for the balance of the year. High silicon and high phosphorus grades are in good demand, as are manganese and manganesite. Enquiries for about 7,500 tons are reported.

Cleveland.—Makers are hanging back from 1920 orders, as they feel that it is too soon to form an opinion of the probable costs. There is a large volume of enquiries, and business which fell off

a little at the end of last week revived at the beginning of this week. Prices are firm.

Cincinnati.—Owing to the closing down of silvery stacks due to labor troubles, high silicon iron is hard to procure. Foundry iron is getting scarce and is quoted at $27.50, Birmingham, for 1.75 to 2.25 silicon. Consumers are buying third-quarter delivery iron to use in first quarter, as first quarter delivery iron cannot be obtained.

Chicago.—With most producers sold up to capacity there is every possibility of higher prices. Further production will be made as two stacks will be blown in very shortly. Southern iron is being beaten in the market here by iron from the Algoma Steel Co.'s plant at the Soo. Malleable is the most active, with silveries scarce.

NOW SEES A SERIOUS SITUATION AHEAD OF THE STEEL MARKET IN U.S.

Special to CANADIAN MACHINERY.

PITTSBURGH, PA., AUG. 28.—The iron and steel market has been dominated more or less in the past week by the labor situation and prospects, if the present uncertainty may properly be referred to as constituting "prospects." The steel mills have been almost entirely out of the market as sellers, except for the booking of such orders as regular customers insisted that they take, while they have been entirely out of the market as buyers, showing no interest whatever in such commodities as scrap, ferromanganese, ferrosilicon, etc.

While the market has been chiefly under the influence of the labor situation, it can hardly be said that the trade at large fully appreciates the seriousness of the situation. The large mills probably do, but even that is not certain. Some of the small mills apparently do not. Buyers have been showing apprehension that at some time in the not distant future there may be a restriction of output through labor difficulties, but few buyers seem to have realized that matters were likely to come to a head by September 1st. That, however, represents an opinion based upon the best collection of information obtainable.

Mills are fairly well sold up and buyers are of course, correspondingly well covered, i.e., the buyers who are jobbers or manufacturing consumers, while buyers who have construction work in view are in some cases covered and in some cases not. There is considerable tonnage involved in construction projects approved, but against which purchases have not been made, and most of this business is held up. For instance, there is a large building which it is desired to erect at once, and which will require 8,000 tons of concrete reinforcing bars. The buyer has been importuning one large mill after another to take the order, without success. A small mill could not handle the tonnage.

In present circumstances there is no issue in the market as to prices. Prices are now more thoroughly "stabilized" than even the Industrial Board of last March and April ever hoped to stabilize them, for no one would, of course, think of cutting prices at this juncture, while talk of advancing prices is altogether taboo. Labor is very restive and to advance any price would simply be to furnish ammunition to labor agitators. That is a fact that the United States Steel Corporation recognized three months ago, and made no secret of, but some of the independents have only lately grasped the point.

Labor Situation

There are really two labor situations. On the one hand the American Federation of Labor has been endeavoring to organize the entire iron and steel industry with the object of securing certain demands or calling a general strike. On the other hand several strikes have actually occurred, at widely separated points. In the past ten days, for instance, there have been three strikes in the sheet industry alone, at Wheeling, W. Va. Canton, O., and Newport, Ky. These and other strikes can hardly be regarded as directly a part of the American Federation of Labor program, for that contemplates a general strike and can hardly be aided by the men going off at half cock at this point and that. A definite indication that the detached strikes have no connection with the general program is that the strike at the steel and wire plant at Peoria, Ill., was settled a few days ago, and on the basis of the men being given a wage advance of 5 per cent. when their demand had been 12 per cent. advance. The Federation demands are much broader, and look more to working conditions than to mere wage rates. There is quite a collection of things they want, embodied in the list of 12 points formulated and made public July 20, including such items as the check-off, abolition of physical examinations, abolition of company unions, the eight-hour day, seniority to apply in employment and dismissals, etc.

The effort to organize the iron and steel trade was inaugurated at the St. Paul annual convention of the American Federation of Labor last year. At the Atlantic City convention last June a report was made, showing the progress had not been up to expectations, and giving the principal cause of the slowness of the work the fact that many municipalities, particularly mill towns in the Pittsburgh district, would not grant permits for holding labor meetings. Organizing efforts were increased, however. Sunday, July 20, a meeting was held in Pittsburgh of representatives of 24 labor organizations, the meeting enunciating a set of 12 demands and ordering that a strike vote be taken, to be completed in 30 days, the vote to be on the proposition, whether the men would back up the "National Committee for Organizing Iron and Steel Workers" should it consider it desirable to call a strike. Another union, that of hod carriers, was afterwards added, making 25. A point in this, as in all American Federation of Labor activities, is that each man must belong to the union particularly adapted. Among the 25 unions are those of blacksmiths, brick and clay workers, bricklayers, machinists, stationary firemen, etc., etc. The rank and file of the workers at blast furnaces and steel mills would belong either to the International Union of Mine, Mill and Smelter Workers or to the Amalgamated Association of Iron, Steel and Tin Workers.

The strike vote was announced at Youngstown on the evening of August 20, but was merely to the effect that 98 per cent. of the votes were affirmative. There is no line on the total number of voters. A statement merely of the number of voters, however, would not be particularly illuminating, and certainly would not be conclusive, for if the voters comprised only 10 per cent., or 20 per cent., of the total number of employees the question would be whether they are men engaged in such work that their withdrawal would cripple operations. For illustration, one of the 25 unions is the "Switchmen's Union of North America." If these men quit others might or might not take their places, but if no switches were turned it would be minutes in some plants and only hours in other plants before operations would have to cease.

On the date the vote was announced the committee decided to allow a period of ten days for the arranging of a conference with the employers, and the intimation has been that if within that period, which ends Saturday, August 30, the manufacturers do not agree to a conference a strike will at once be called. It is altogether improbable that the manufacturers will refuse to enter a conference and do nothing else. It is likely they will close their plants suddenly if they foresee a strike coming, although they may agree to confer. There being no organization of iron and steel manufacturers which the organizing committee can approach, its course was to address a lettter to Judge Gary, as the head of the dominant interest, and they followed this by going to New York in a body at the end of last week. Mr. Compers was expected to arrive in the United States from his trip abroad August 27, or before the time limit expired and in time for a conference.

A. T. Weldon, formerly assistant traffic manager of the C. P. R. at Moncton, N. B., has been appointed to a similar position with the Company, with headquarters at Montreal, succeeding Guy Tombs, who has resigned. M. F. Tompkins will succeed to the position vacated by Mr. Weldon.

Peace Time Exhibits In Machinery Hall C. N. E.

Manufacturers and Agents Have Representative Display of Machine Tools and Industrial Equipment at Canadian National Exhibition.

PEACE time activities are reflected in the various exhibits in Machinery Hall this year. The entire absence of shell machinery and munition-making apparatus is quite noticeable, albeit expected to those accustomed to the exhibits of former years. Space is again at a premium, and as usual comment unfavorable and forcible is apparent at the inadequate provision made for the machinery industry.

Exhibits

The Deloro Smelting and Refining Co. have an exhibit of their well-known Stellite alloy for cutting tools, comprising milling cutters, arc welded tools, etc. In addition to this they have an exhibit of the other products made at their refinery including cobalt and nickel metals and oxides, metallic powdered aluminum, refined arsenic, etc. Representatives, Thos. Southworth and B. Horwood.

Geo. W. Cole, Ltd. are exhibiting the Cole steam trap in its various designs. Cross-section models of the working parts of these traps are shown, and a typical double trap boiler feeding installation, together with other features, render this exhibit interesting to the power plant engineer. Representative, Wm. H. Rose.

Baines and Peckover are displaying concrete reinforcement materials in various forms, and Teralun anti-slip treads, plate and coal hole covers, Steelcrete expanded metal machine guards, etc. are also featured, together with an excellent display of Triumph superb high-speed steel, cold drawn and nickel steel bars.

The Dodge Co. are featuring steel pulleys, wood split pulleys, transmission chains, split clutches, hangers and bearings, conveyor material, gears, couplings, etc. Representatives, W. Burrows, S. M. Bowen, J. R. Gray.

The Cleveland Pneumatic Tool Co. of Canada, Ltd., are showing a complete line of pneumatic tools and appliances such as are used extensively in the shipyards of Canada and the United States. A line of compressed air drills, accessories and hose is also shown. Representatives, C. D. Garner, manager Canadian division, and D. C. Lacy.

The Garlock and Walker Machinery Co. have a very representative display of the various lines handled by their firm. These comprise a Gooley-Edlund Co. miller; a Steptoe 20-in. shaper; a Bath No. 2 universal grinder; a Fitchburg 8 by 36 in. cylindrical grinder, and Ryerson-Conradson single pulley milling machines. Their pneumatic and electric tools are also shown. The Cataract line of lathes is also shown in a very complete manner. Representatives, Mr. Garlock, Mr. Walker and Mr. Brown.

Jones and Moore have a representative display of their various motors and generators and of the American shoe machine for which they are the agents. This firm handles a large stock of Century motors for all conditions of service.

The Canada Machinery Corporation have a fine exhibit of iron and wood-working tools. This exhibit includes a straight-edging and jointing machine for furniture and piano factories, a hollow chisel mortiser, a heavy pony planer, and a universal rip and cross-cut saw. The iron working tools comprise a 20-in. back-geared power feed drill press, a 14-in. double back-geared quick-change engine lathe, a 20 by 22 in. back-geared crank shaper. The 14-in. quick-change tool room lathe is one of the newer products of this firm, and is notable for the ease with which all changes in feeds and speeds can be carried out. Representatives, D. King, M. M. Preston, J. C. Carley, P. B. Burton, H. O'Donnell.

The Canadian Ice Machine Co. have an excellent exhibit of refrigerating supplies and materials; fittings, ammonia, calcium, chloride, and other supplies being featured. This firm are the manufacturers of the York refrigerating systems and compressors, installations being made from ¼ ton up in the direct expansion, absorption or CO_2 systems, the latter being popular and of considerable adaptability for hospital and marine work.

The Cling Surface Co. are exhibiting for the eleventh consecutive year. The preservation and waterproofing of belts and the lowering of the friction load consequent upon the permissible slackness of the belts are shown to advantage by means of a one h.p. motor driving a three-plunger oil pump through a number of belts treated with cling-surface. Representative, G. W. Faatz.

The A. R. Williams Co. have an excellent display of iron and wood-working tools. A variety of drill presses is shown, including a 22-in. Barnes back-geared power-feed drill with automatic stop and sliding head. A heavy duty universal milling machine of Le Blond make is on display together with a universal cutter and reamer grinder by the same firm. A Gould and Eberhardt 24-in. crank shaper is shown, and a No. 4 Warner and Swazey universal turret screw machine is also displayed. A Le Blond 18 by 8 engine lathe, fitted with quick-change gears also forms part of the iron working tools. Marine internal combustion engines are shown together with others adapted to stationary use. Woodworking machinery is well represented by means of a 24-in. planer built by the MacKenzie Machinery Co., Preston; a 36-in. bandsaw, built by the Preston Woodworking Machinery Co.; a MacKenzie planer and matcher, and a MacKenzie saw table. The supply department is also well represented, featuring with Starrett tools and Brown & Sharpe cutters, reamers, etc., together with plumbers' and steam fitters' brass goods. As in former years, this excellent exhibit is under the charge of Mr. Cronk, and the arrangement is due to him.

The Chapman Double Ball Bearing Co. have, as usual, a most attractive exhibit of the various lines manufactured by them in the centre row at Machinery Hall.

In addition to the ball-bearing shaft hangers used in the line shafting, the exhibit includes bearings for all sizes of shafting up to six inches; also annular and thrust bearings for machinery, automobiles and trucks. Representative, Mr. Hocken.

D. K. McLaren Ltd., represented by Mr. W. S. Hamilton, sales manager, are exhibiting their line of single and double leather beltings, together with their waterproof varieties. In connection with these latter an interesting demonstration is given. Two belts are arranged to pass through pans of water while turning over pulleys. Other lines shown are the D. K. wood split pulleys, the Philips pressed steel split pulley and mill supplies for the carding, weaving and spinning trades.

The Goodyear Tire and Rubber Co. are showing a complete line of mechanical rubber goods such as thei fire hose, extra service pneumatic hose, and Goodyear cord hose, extra power belting, packings, perforated mats, etc. Representatives, W. H. O. Crosby, F. Woods, F. Fox, and E. Dodge.

The Dominion Belting Co., Ltd., are exhibiting Maple Leaf brand stitched cotton duck waterproof belting for transmission of power and conveying. This is shown in various sizes, and excellent literature is distributed, showing its capabilities and endurance. Maple Leaf belt dressing is also on exhibit. Representative, John Scott.

Cowan and Co., Galt, are showing some of their woodworking machinery. Among the machines on exhibit are a chain saw mortiser, a hollow chisel mortiser, a power feed rip saw, and a universal woodworker. This latter machine combines the functions of rip and cross-cut saws, buzz planer, borer and hollow chisel mortiser into one machine. A power jig saw is also shown, and a new machine recently patented is shown in their patent hoop bender. This ma-

chine will bend barrel hoops without steaming and by an entirely new process. Representative, Mr. Cowan.

The Hoyt Metal Co. are featuring their lead-lined and resisting products such as valves, centrifugal pumps. Together with this line they are displaying their various other lines of metal goods such as solder, babbitt type metal, etc. Representatives, G. F. Allen, manager; S. Wheatley and W. G. Downes.

The Perfect Machine Co., Galt, are exhibiting a 12 by 6 in. lathe, a line of grinders with attached guards and a new line of buffing machines. Drilling machines and power hack saws are also shown. Representative, S. L. Clark.

The Lyman Tube and Supply Co. are featuring Shelby seamless steel tubing, together with the Chisholm and Moor anti-friction hoists. These latter are capable of 80 per cent. efficiency and are made in sizes up to 40 tons. Hyatt, Timkin and New Departure ball bearings are shown, together with electric railway supplies, made by the Electric Service Supplies Co. Chain belt and Rex products are also shown. Representatives, H. A. Jones, J. E. Openshaw, R. B. Bennett and Wm. Gardiner.

The Canadian Kron Scale Co. are showing a line of industrial scales. Representative, Mr. Smith.

The Wayne Forge and Machine Co. are showing their line of industrial brick and furnaces.

The Davis-Bournonville Co., of Toronto, have a fine exhibit of portable cutting and welding plants, acetylene generators and flare lights. An emergency cutting outfit for the use of fire departments is a feature that will attract notice. The No. 2 Oxygraph is an instrument to facilitate the cutting of any intricate shape in metal from one-quarter of an inch to 21 inches thick. The Radiagraph is another instrument on somewhat similar lines but used for cutting circles and straight lines. This can be bevelled to any angle, and the machines are portable. The firm is represented by J. F. Crowley.

Prest-o-lite have welding and cutting apparatus, supplies for same, contractors' flare lamps, dissolved acetylene and laboratory equipment on exhibition. They have also brazing and soldering apparatus, acetylene headlights for auto trucks, launches and locomotives. The representatives at the booth are F. T. Northwood, A. V. Tuthill, and A. W. Gimble.

The Climax Baler Co., of Hamilton, are showing a number of hand power balers for waste paper and other material which needs to be made up in small bales.

The John Hall & Sons, Ltd., Brantford, represented by Mr. Thompson, are showing several examples of their pipe threading machines. The large machine which can handle pipe from 2½ inches to 8 inches diameter is a fine looking piece of work, while the smaller sizes are also worthy of examination.

The Globe Engineering Co., of Hamilton, have quite a good variety of articles on view. Their lines include an electric welder, tool and cutter grinder, machine vices, lifting jack, and the Crowe roller bearing for automobiles. One of the most interesting exhibits is the loose chuck and special cutters for drilling square, triangular, hexagon or other angle holes. Several specimens of this class of work are on view. Mr. F. W. Robson is representing the firm at the Exhibition.

The Boiler Repair and Grate Bar Co., of Detroit and Toronto, have an exhibit of their shaking and dumping grate bars. These bars have been fitted in several

Continued from Page 240

local schools and public buildings. Mr. A. H. Hett and Mr. O. C. Hett are in charge of the exhibit.

The Canadian Hauck Burner Co., Ltd., are showing a number of their coal oil burners, which are in general use in foundry and shipyard work. Mr. Housel is in charge of the booth.

The Elliot Woodworker are exhibiting woodworking machinery, both electrically and gasoline-driven machines. A notable feature of these machines is the type of belt used, which consists of links of raw hide, with a steel core. This belt is claimed to be absolutely nonslipping. Mr. Elliot and Mr. Bradley are demonstrating these machines.

The British Aluminium Co., Ltd., have a number of different articles made from this light and strong material. These include cooking utensils, tubes, wires, cables, etc. There are also a number of pigs of the metal in the booth.

The Lightning Evaporator Co. of Dunham, Quebec, have one of their maple syrup evaporators set up all ready for use. The furnace is designed to burn either wood or coal, and the evaporator consists of a number of shallow vessels into which the maple syrup is poured. Mr. Len Emonds, of Smith's Falls, the Ontario agent for the company, is in charge of the booth.

The Clemens Electrical Corporation of Canada, with headquarters in Hamilton, are showing their electrical soldering irons, and as these irons work at a voltage of 8 volts, the necessary transformers are also included in the exhibit. An interesting feature of the booth is the J. C. refillable fuse, a very neat and economical type of this largely used article. The booth is in charge of Mr. R. C. Guest.

L'Air Liquide Society have a very ef-

A CROWD AT THE EXHIBITION GROUNDS

fective display of oxy-acetylene welding appartus, consisting of gas cylinders, torches of various kinds, and complete outfits made up ready for use. For those visitors who are not familiar with the class of work that can be done with these outfits, a lantern has been installed in the booth, which throws on a screen interesting illustrations of welding jobs. Mr. Turnbull and Mr. Godfrey are the representatives of the firm at the exhibition.

The Pratt & Whitney Company, Dundas, are showing a line of their tools, including cutters, drills, taps, effectively displayed in attractive show cases. Mr. Maver is in charge of the booth.

The Canadian General Electric Company have an electric welding exhibit on view, which they are demonstrating to anyone interested. The machines are the direct current type operating at 60 volts.

The Consumers Gas Company of Toronto have a number of gas furnaces of different styles on exhibition. These are for industrial purposes such as tempering tools, annealing etc. There are also various styles of gas torches and a brazing table autfit. These should be of interest to users of gas appliances.

The Dunlop Rubber Company, represented by J. R. Thompson, have a very effective display, consisting of a belt conveyor, elevator, and drive belt all in operation. The background of the booth represents a quarry in operation, showing the different uses to which rubber belting can be put in conveyor operations. They have also different types of rubber hose, and a full line of rubber goods.

The Allen GGeneral Supply Company, represented by Mr. Wilkes, are showing a number of power plant accessories designed to effect economy in fuel consumption. The well-known Venturi Feed Water Meter is the principal of these appliances, backed up by the Copes Boiler Feed Water Regulator, the Dwight CO_2 Indicator, and the Howell electric motor. In these days of high fuel costs, this exhibit should receive considerable attention.

The W. R. Sexton Boiler Setting Co. are displaying a full line of fire bricks, nonpareil grate bars and boiler settings. They have also a line of engine and pump packings, representing the William C. Wilson Co. in these lines. Mr. Sexton has charge of this exhibit.

The Thomas Davidson Manufacturing Company, of Montreal, have an exhibit of steel castings, made in their electric furnaces at Turcot. Prominent among these is a line of anvils, which attract considerable attention from visitors. A cast steel shaft in the rough state is also on view, with other products of the same material. The firm is represented by Mr. Flack the Toronto manager, and Mr. Wasson.

TWO BOOKS ON MACHINE AND FITTING SHOP PRACTICE

By GEORGE W. BURLEY, Wh. Ex. A.M.I. Mech. E.

These two books are published by Scott, Greenwood and Son, 8 Broadway, Ludgate, London, E.C.4., and comprise the following subjects, which are gone into in considerable detail.

Volume 1 takes up materials of construction, shop measurements, measuring instruments, gauging and gauges, setting out with tools and operations; the vice, the hammer and chisel, and the art of chopping; files, their forms and uses; and scrapers and scraping.

Volume 2 covers planing, shaping and slotting; drilling, boring and reaming; milling, and gear wheel cutting; lathe work, grinding and lapping; screw thread cutting, and interchangeable system of manufacture.

212 pages, and 194 illustrations, with 4 tables, comprise volume one, while 242 pages, with 238 illustrations and 9 tables forms volume No. 2.

These books have been written especially for engineering works' apprentices and college and technical school students for use in connection with their practical work.

Great attention has been placed on the actual working processes, operations, etc., rather than the machines themselves. This fact will be appreciated by student readers.

These books are both listed at the very reasonable price of six shillings net, and can be had direct from the publishers.

The American Malleable & Castings Association, Cleveland, have issued a book on Malleable Iron, which takes up the mechanical and physical properties of this material in an admirable manner. The composition of malleable cast iron is dealt with and the remainder of the book is devoted to the various physical and electrical properties which make malleable iron a useful material in the arts.

Messrs. Longmans, Green & Co., of New York and London, have just published a book by J. Mitchell, A.M.I.N.A., and edited by Edward L. Atwood, O.B.E., M.I.N.A., on Naval Architects' Data. The first pages of the book are devoted to formulae, tables, etc., which are in daily use by the naval architect. The following pages of the book are devoted to data sheets, in which all the particulars appertaining to calculations for a ship or a number of sister ships are collected together, with blank spaces opposite each one for the insertion of the figures. These are divided into sections, the first one being devoted to length, breadth, depth, speed, etc. Then comes numerals, midship sections, lines, estimating summary weights, rudder, bunkers, drafts, tonnage, freeboard, capacities of holds, shipbuilders' auxiliaries, engines, boilers, electrical installations, boats, etc. The book is printed on good paper and bound in cloth. It should, if filled up conscientiously, form a very valuable reference book for the naval architect and shipbuilder, in a compact and permanent form. The price is $3 net.

R. F. Baldwin, treasurer of the Oliver Machinery Co., Grand Rapids, Mich., will spend the week of August 25 on a fishing trip in Northern Michigan. He is an ardent fisherman.

H. R. Charlton, of the Grand Trunk publicity bureau, has been appointed to accompany H. R. H. the Prince of Wales while he is touring through Ontario on the Grand Trunk lines. Mr. Charlton has been the Company's representative on the various tours of visiting notables during the past twenty years. He was awarded the Order of the Sacred Treasure by the Emperor of Japan following the visit to Canada of the Prince Fushimi.

The S. S. Faraday, the largest cable laying vessel in the world, has just taken determined efforts of ventilating engin on a cargo of grain for overseas. The Faraday is over 20 years old and has laid practically every long distance cable in the world. During the war this ship put down a 1800-mile cable between Ireland and Newfoundland, and while on the work was escorted by a cruiser and a dozen patrol boats, succeeding in laying the cable on one trip, without a hitch.

About ten per cent advance has been made on transatlantic passenger rates, this being equal to $5 to $15 per trip. This action has been found necessary owing to the higher working costs due to the dock strikes in British ports, and the general advance in operating expenses. This new ruling went into effect on August 20.

According to the estimate of the British Advisory Committee of the Ministry of Reconstruction the existing airplane factories in England are capable of the production of 40,000 airplanes and 30,000 motors a year, and are able to supply spare parts for an air force of that size.

Electric Mine Hoists. What is said to be the first electrically driven mine hoist in the world was of 10-h.p. and installed at Aspen, Colorado, July, 1888. Contrasted with this is the hoist at the Crown Mines, South Africa, driven by two 2,000-h.p. electric motors.

Sydney Coal to Scandinavia.—The Furness-Withy Line recently made an experimental shipment of three thousand tons of coal to Norway. That the experiment proved successful is evident from the fact that an order for ten thousand tons has been received. This will be shipped in Norwegian steamers at the beginning of next month.

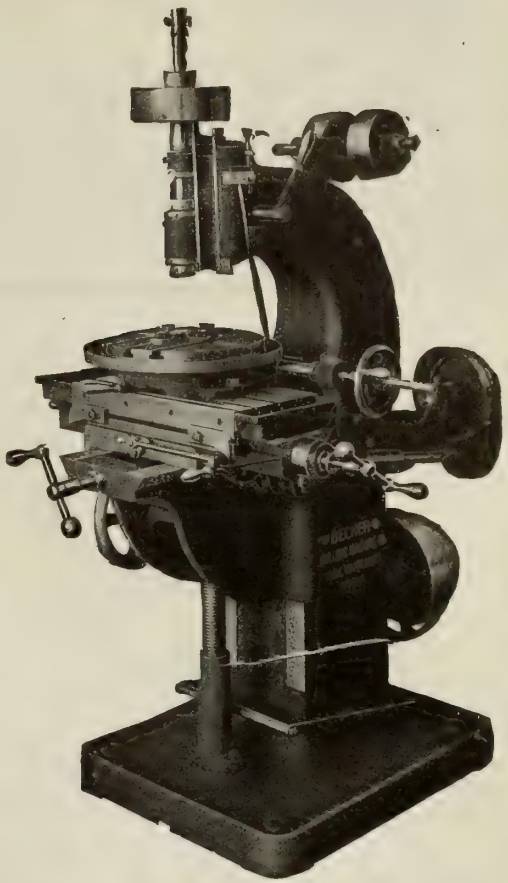
BECKER

Belt Driven Millers

The Machine that Gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker production. Adopt this "safety-first" course; it may mean added profits to you.



The A. R. Williams Machinery Co.
LIMITED, TORONTO

Acid Electric STEEL CASTINGS

Acid Electric Steel Castings show superior ability to resist wear and crystallization. They are smooth in texture, free from Blow Holes, and machine perfectly. We specialize in

Railroad and Other High Grade Castings

up to 15 tons, any specification. Electric Steel Castings COST NO MORE than ordinary Steel Castings.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Sydney, N.S.—The Sydney Foundry and Machine Company of Sydney, N.S., who conduct a large repair business in marine lines, are applying for a site upon which to build a dry dock for this port.

Fireman Scalded.—Through the blowing off of a cap on the boiler of the Smith Manufacturing Company, East Front Street, Toronto, a fireman was badly scalded about the face and arms. The man's name was John Smith, and he is 55 years old. He was removed to the St. Michael's Hospital.

Canners' New Offices.—The Dominion Canners have purchased new office premises in Hamilton. They have bought the old Bell Telephone building on Hughson street, the price being reported to be over $50,000. Their present offices are in the Landed Banking & Loan Building.

Steel Employees Want More.—Some of the employees of the Steel Company of Canada at their Hamilton works are demanding increases in wages. These men were not included in the recent 10 per cent. advance. The firemen are claiming an advance of 13½ cents an hour.

Lake Huron Steel Corporation.—A site has been secured at Goderich for this concern and all other preliminaries have been settled. The site comprises 250 acres along the shores of Lake Huron. The company undertakes to spend $2,000,000 in the first year, and $6,000,000 in the second year, in establishing its plant. The equipment will include six electric furnaces.

Improved Employment Conditions:—Reports to the Department of Labor from employers in the provinces of Ontario and Quebec show improved conditions. During the week ending August 9th, 2,686 firms increased their employees by 591, an increase of .2%, and a further increase was expected the following week which would bring it to 6 per cent.

Surveying for Hydro-Electric. — A start has been made on the long projected line from Port Colborne to Bridgeburg, the Hydro surveyors having started surveying the proposed route. The party have progressed as far as Fort Erie and are expected to finish shortly. As soon as the survey is complete it will be sent to the headquarters of the Hydro Commisison, and the purchase of the right of way will be taken up at once.

New C.P.R. Locomotives.—The new locomotives put into commission by the Canadian Pacific Railway are powerful machines. They will be operated on the Montreal to Toronto division, and are capable of hauling a train of 100 cars. They are in fact doing this daily between Smith's Falls and Montreal. The boilers hold over 11,000 gallons of water, and between Smith's Falls and the Outremont yards they burn 16 tons of coal.

Port Colborne.—The body of Alex. Beck, badly mutilated, has been found in the hold of the barge Quebec, but there has as yet been no sign of the body of Arthur Dunlap. Both men were missing from the time of the disaster at the grain elevator here. The barge was floated by the Clarence Lebau wrecking outfit from Toledo, and is now at the Government elevator dock. A considerable quantity of grain is still on board. The vessel is badly damaged, and a large amount of debris is on her decks.

An All-British Wireless.—The Imperial Investigation Board are now busy developing a scheme by which the whole Empire will be linked together by wireless. The invention is to link the Dominions to each other as well as to Great Britain, thus bringing into closer communication some of the further away dependencies, which have hitherto been rather out of it. This work will complete the work commenced by Sir Sandford Fleming many years ago with the submarine cable.

Stands by the Ferry Co.—Ex-Mayor Charles R. Tuson, of Windsor, is circulating a petition to withdraw all objections to renewal of the Windsor Ferry Co's license to operate between Windsor and Detroit. Mr. Tuson, in addressing the Chamber of Commerce, urged that the City Council were wrong in withholding their support from the Ferry Company in the latter's endeavor to get an extension of their franchise from the Dominion Government. He claimed that the slight increase in fare had met with no opposition from the public.

Shelburne.—Detroit, Brantford, and Toronto men are interested in the development of the oil or gas fields in the vicinity of Markdale, Grey County. A company is being organized under the name of the Detroit Canadian Oil and Gas Company, Limited, the capital being $60,000. The public will be offered $30,000 in $50 shares, and as soon as this amount is in the treasury, drilling will be commenced. Machinery capable of drilling to a depth of 4,000 feet has already been ordered. It is claimed that there is a rich field here awaiting exploitation.

The British Preference.—The list of goods to which preference will be extended if produced in the British Empire has been announced. Tea, cocoa, coffee, chicory, currants, dried and preserved fruits, saccharine, motor spirits and tobacco pay five-sixths of the full rate of duty. Motor cars, musical instruments, clocks, watches and cinematograph films pay two-thirds. Wine not exceeding 30 degrees proof spirit will pay 60 per cent. of the full rate, and wine exceeding 30 degrees 66 2-3 per cent. Unbottled still wines, 50 per cent. of the full rate of the additional duty will be charged. The preference will be extended on spirits by increasing the duty on spirits not produced in the Empire, four shillings per gallon on perfumed spirits, three shillings and fourpence a gallon on liquors, and half a crown per gallon on spirits of other descriptions.

TENDERS

The Hespeler Water Commission want tenders for the laying of 5,448 lineal feet of water mains. Tenders addressed to M. E. Jardine, Town Clerk, will be received up to August 30, and plans and specifications can be obtained from the office of the town clerk.

The Department of Public Works are calling for tenders for the construction of a wharf at Boisdale, N.S. Tenders will be received until 12 noon, September 3, and plans and specifications can be seen at the office of the district engineer, North Sydney, or at the Post Office, Boisdale, N.S.

The Department of Public Works are calling for tenders for the repair of the wharf at St. Jean D'Orleans, Montmorency County, Quebec. Tenders will be received until September 3rd, and plans and specifications can be obtained from the district engineer, Post Office, Quebec; Shaughnessy Building, Montreal and Post Office, St. Jean d'Orleans.

The Department of Public Works of Vancouver is calling for tenders for the erection and completion of a bridge on River Road, near Haney B.C. Plans and specifications can be obtained from the office of the District Engineer, Court

GEOMETRIC

"YOU CAN'T BEAT 'EM" SELF-OPENING DIE HEADS

It is not the manufacturers of Geometric Self-Opening Die Heads who make this statement, but the users of the tools.

This is the reason that besides being the originators, we are known as the

LARGEST AND BEST KNOWN MANUFACTURERS OF AUTOMATIC THREADING TOOLS

The big question is: Have you applied Geometric Screw Thread Cutting Tools to your threading work?

MARINE

Quebec.—The steamer Glen Allen, belonging to the Kirkwood Line, on Montreal, has been put into drydock for an examination, after having scraped her bottom on the rocks a few miles west of the Quebec Bridge.

Quebec.—While entering Quebec harbor the steam barge Captain Dan, commanded by E. Gamache, struck a wharf and sank before she could be beached. The cook, Mrs. Annie Taylor, was drowned, but the rest of the crew were rescued from a capsized rowboat on which they had found refuge.

Quebec.—The salvage tug Lord Strathcona has been despatched to the aid of the steamer Admiral Hastings, which left Montreal for England recently, and is now ashore on Baggot Bluff, the south point of Anticosti Island. She reports being hard and fast, and unable to refloat with her own power.

Quebec.—S.O.S. calls were received from the steamer Verdullia, which had struck an iceberg in the straits of Belle Isle, while on a voyage from Quebec to England. After the first calls were received, a later one gave the information that the vessel was apparently not badly damaged, and was proceeding on her voyage.

Port Colborne.—While towing the steamer Glen Lyon down the canal to load paper at the Ontario Paper Mill wharf, the tug Alert caught on a shoal, and before the hawser could be released she was drawn under on her side and sunk. The crew all rushed to the high side and jumped when she commenced to capsize, and were rescued with some

difficulty from the canal. The Alert will be raised.

Prince Rupert, B.C.—The new car ferry slip at Prince Rupert has been commenced and is expected to be completed in October at a cost of $50,000. It will be built to accommodate a car barge carrying nine loaded cars, and three cars at a time can be unloaded or loaded.

Halifax, N.S.—The steamer "Chaudiere," of the Royal Mail Steam Packet Company's fleet, struck a rock going into Hamilton, Bermuda. There is a narrow channel between two rocks which come close to the surface and the vessel's starboard side struck one of these, tearing a hole in it. She had about 100 passengers for Barbadoes and Demerara, and these will have to be transhipped as she is too badly damaged to continue the voyage.

Collingwood.—The former lake steamer "Codorus" has been salved from the rocks at Escamanick Point in the Gulf of St. Lawrence by Capt. Reid of Port Huron. The vessel, which was formerly owned by the Anchor Line on the Great Lakes, was taken over by the United States Shipping Board and taken through the canals to the sea after being cut in two. She was joined together in Montreal, but her career on the salt water was brief. She was given up as a total loss, but after five weeks' work Capt. Reid was successful in floating her. He did the work on a percentage basis.

Halifax.—Six men of the crew of the schooner Francis A. were lost when the schooner was rammed and sunk by the steamer Lord Downshire, belonging to the Ulster Steamship Company of Belfast. The collision occurred while the schooner was fishing about 120 miles south of Halifax, in a thick fog, and the Lord Downshire was bound from Baltimore to Belfast with a general cargo. After the collision the steamer lowered a lifeboat and rescued fourteen of the crew of twenty, but the remaining six were never seen. The names of the men who were drowned were Capt. Percy Ross and Ainslie Ross his brother, both of Broad Cove, N.S.; Tom Muise, Belleville, N.S.; James Gardner, Argyll, N. S.; Joe Harris, Yarmouth, and Fred Fitzgerald, no address known.

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

AGENCIES WANTED

WANTED — AGENCY OF SPECIALTIES FOR hardware factories and mills for Quebec city and district. Best connections and references. Reply to G. A. Vandry, 28 St. Joseph St., Quebec. (c8m)

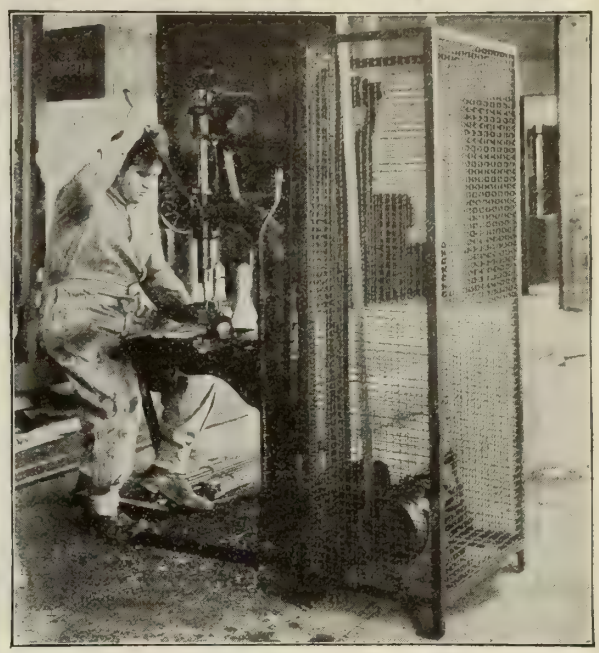
Oxy-Acetylene Welding and Cutting



Used Wherever Machinery Is In Constant Daily Use

In nearly every line of metal manufacture, from the making of delicate jewelry to massive locomotives, the Prest-O-Lite Process of Oxy-Acetylene Welding has firmly established itself. Where two pieces of metal are to be joined, it is supplanting the bolt, rivet and threaded joint in hundreds of factories and repair shops.

Metal lockers, as shown in the illustration, and metal equipment of all kinds can be produced at less cost by this process.

Wherever metal or machinery is produced, moulded, built, shaped or USED, there a Prest-O-Lite outfit will be found of inestimable value.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

TRAHERN PUMPS

We positively guarantee that our pumps will deliver all the coolant that can be forced through the discharge opening, according to the size of the pump used, while operating from 300 to 500 R.P.M. A centrifugal pump delivering the same sized stream of lubricant must operate at a speed of at least 1000 R.P.M. This excessive rate of speed necessarily results in a short lived pump.

A Trahern operates at low speed and has long life.

Write for Particulars.

TRADE MARK

Right Side Up or Up Side Down

"W & B" Twist Drills and Reamers are frequently called upon to perform an unusual job. Take a look at the above picture—it's one instance of where "W & B" "Hercules" High Speed Twist Drills are the choice of mechanical engineers who do big jobs and know how to do them right.

Ten 7/8 inch tap holes (47/64) were required on each of two sides to a section of a huge marine condenser. To save the time and expense of turning this section over, and eliminate the possibility of breakage, this job was done easily and quickly as here pictured. A spindle was rigged up on top of a big 6-foot radial drill press and the holes drilled upside down.

Simple, wasn't it? But, the Wheeler Condenser & Engineering Co., of Carteret, N.J., who did the job, find they can put "W & B" "Hercules" High Speed Twist Drills to satisfactory use in all kinds of intricate work.

People who have big ideas like this, prefer to use the products that come from similar big ideas. The "W & B" idea is—

"Make it better than anybody else can make it, put your name on it, and stand by it."

Want to Increase Your Production?

You can do it, and at a minimum operating cost, by installing this machine. We know this to be a fact from the experience of our many customers who have already made installation. How can it produce otherwise than best results, when all gears are accurately cut from the solid, gears in power feed mechanism of steel; bearings throughout bronze bushed; and all control within easy reach of the operator? It's sure some fine machine! Let us prove it to you.

Get our printed matter to-day, giving details.

News for Gasoline Engine Builders

A new Landis Crank Grinding Machine with the old traditions of Landis accuracy and production.
The crank shafts are driven from both ends, both right and left hand crank heads being geared together. A micrometer sliding adjustment with graduated dial, on the crank carrying fixtures, adjusts the machines for the grinding of different throws.

The crank head spindles are of large diameter, with long phosphor-bronze bearings adjustable for wear. The spindle gear is mounted between spindle bearings, an arrangement which permits of mounting the work-carrying fixtures directly on the end of the spindle, close to the bearings. This construction reduces overhand to the minimum.

ARMCO IRON Welding Rods

OXY-ACETYLENE ELECTRIC

make *safe* welding easy

Armco Rods are 99.84 per cent. pure iron. No other fillers equal them in purity and uniformity of composition. Two kinds of rods of guaranteed analysis, one for electric and one for oxy-acetylene welding, do all the work (and better work) that formerly required many different compositions. Armco Rods flow freely, weld evenly, and give a joint that lends itself practically to all finishing operations. Send for booklet.

Speed in Cutting Off

Hurlbut, Rogers

Cutting-Off & Centering Machine

TWO CUTS AT ONCE—one up, the other down. This is what makes the Hurlbut, Rogers Cutting-Off and Centering Machine virtually double the output and reduce the cost per piece one-half.

You should learn more about it. Write for description to-day.

Blast Gate Supersedes Gate Valves and Stop Cocks

"Would certainly recommend this type of blast gate to anybody using pressure blowers."

CHAPMAN DOUBLE BALL BEARING CO. OF CANADA, LTD.

Toronto, Ont.

For low and moderate pressures our New Air-Tight Blast Gate easily supersedes the heavy, cumbersome, expensive and slow-acting gate valves and stop cocks.

Costs only a fraction of what you pay for gate valves and stop cocks and saves time and labor.

Write for Circular 123-T. It tells how our blast gate is made, how it works and what users think about it.

A Favorite—

Blount Pattern-makers' Lathe

FAST AND ACCURATE—Equipped with set over swivel tailstock and carriage, and outside face plate and tripod. Built in 16" swing with beds 6 or 8 feet in length. Spindle is made of high carbon steel, is hollow and fitted with Morse Taper and runs on self-oiling bronze bearings.

Our catalog gives a full description of this strong and highly efficient machine, also our other quality speed lathes and grinders. Give us your address.

J. G. BLOUNT COMPANY
EVERETT, MASS., U.S.A.

Would you like to have us prove that

Peerless HIGH SPEED

Machines do 50 to 100% more work

The Peerless has established a new standard of production in so many plants that we are ready to ship one at our expense and risk, if you agree to give it a thorough test. A trial like this often results in our selling from 1 to 10 machines.

The Balance Lift of the Peerless

automatically raises the blade for the return stroke. This greatly prolongs the life of the blades, economizes power, and increases production. There are more good features which we shall be glad to acquaint you with.

The Peerless assures you the peak of production at very lowest cost. Write for full details.

LIMITED

WELLINGTON MILLS

LONDON, S.E. 1., ENGLAND

AUTOMATIC MILLING IS ECONOMICAL MILLING

Machine is always cutting metal. While the attendant is loading one vise or fixture the cutter is milling work carried on the second table.

The finished work is never returned under the cutter, thus avoiding all marks or scratches on the milled surface.

We want you to know more about the wonderful possibilities of this automatic milling machine for your duplicate milling.

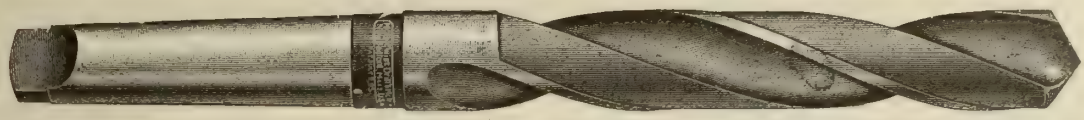
"MORSE" DRILLS



Are designed by scientific experts who have had years of valuable experience in making Drills, hence you are always sure of the

QUALITY IN "MORSE"

If you would increase your output, include "MORSE" DRILLS in your next order.

MORSE TWIST DRILL & MACH. CO.
NEW BEDFORD, MASS., U.S.A.

Cleveland Sand Rammers

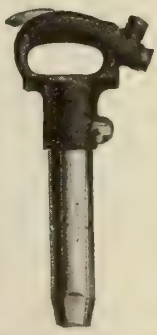
FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.



BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Write for Bulletins, 34A, 41 and 43.

NATCO

On Flange Work

The drilling of 15 Rear Axle Truck Housings is completed every hour. Each housing has 10 holes 1⅜ in. deep, which are drilled in one operation by NATCO

The Maxwell Motor Company of Newcastle, Indiana, gives the information in this instance.

The machine is equipped with the NATCO patented feature—independent change of speed for each spindle—making it possible to drill, ream, tap, counterbore or spotface different size holes in one operation. Greater production, lowered costs and dependable accuracy are NATCO results whenever the work calls for operations on more than one hole.

NATCOs are built in 11 sizes ranging from 2 to 72 spindles.

We also design and build jigs and fixtures for use in connection with the NATCO Multi-Drillers.

The National Automatic Tool Co.

Richmond, Ind., U. S. A.

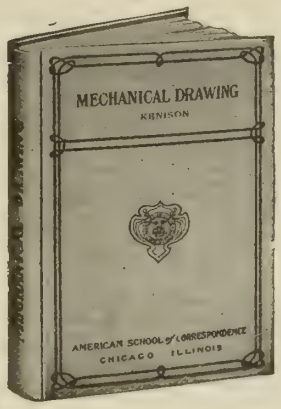
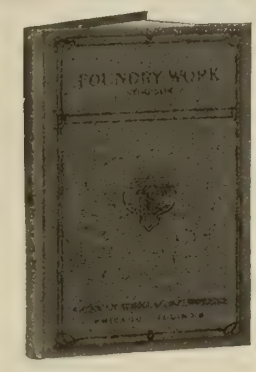
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

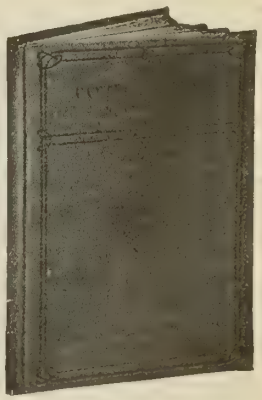
MACHINE-SHOP WORK. By **Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price $2.00



MECHANICAL DRAWING. By **Ervin Kenison, S.B.,** Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.25



FOUNDRY WORK. Revised by Burton L. Gray, instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, $1.25



PATTERN MAKING. By **James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price.....$1.75

MACHINE DESIGN. By **Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price ... $1.75

TOOL MAKING. By **Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.75

FORGING. By **John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.25

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers. Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

WRIGHT HOIST

Will Solve Your Lifting Problems

In mines, mills, foundries and industrial plants, on sugar plantations, in office and commercial buildings, on board ships, in fact, wherever there is lifting of any kind (up to 30 tons) to be done, Wright Hoists serve with that inimitable service which has made the name a synonym for satisfaction.

Let us tell you the cost of a Wright Hoist for your work and show you how it will save that cost many times over.

Williams' "Vulcan" Drop-Forged Safety Lathe Dogs

DESIGNED to insure the maximum of safety, care was taken to provide a form as close to a circle as possible—no bunching or extension of the head portion, no "sleeve-catchers" to cause injury to the unwary operator.

They provide safety complete and automatic, and with this assured safety, better balance on the lathe and every whit of utility obtainable in this class of tool. The price is the same as for the dangerous kind.

Bent and Straight Tail, 1 or 2 screws, 16 sizes, 3-8 to 6 inch capacities.

60 Rivets in a Minute

Faster if the work can be fed faster.
But at least 60 every minute.
And in tightest corners just as fast. Every head just as smooth. Not a bent shank; not a tool mark on either rivet head or casting.

GRANT

RivetSpinning Machines

handle any rivet up to ¼-in. shank.
If Grant-made, every hard steel rivet is finished as smooth and as true as every rivet of soft brass.
The Grant Book called "Perfect Riveting" tells how to give an extra appearance of quality to your product. For your copy

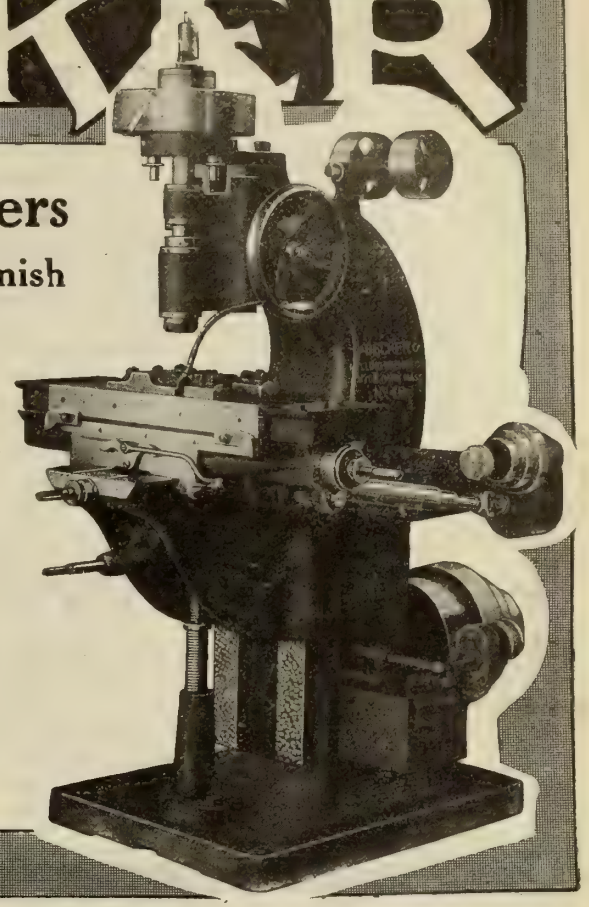
BECKER

Belt Driven Millers

The Machine that Gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker Production. Adopt this "safety-first" course; it may mean added profits to you.



Becker Miller Machine Co.

Hyde Park, Boston, Mass.

CANADIAN AGENTS: Rudel-Belnap Machinery Co., Ltd., 137 McGill St., Montreal, Que. A. R. Williams Machinery Co., Ltd., 64 Front St. W., Toronto, Ont.

"The Marshalltown Throatless Shears"

guarantees perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

Marshalltown Mfg. Co.

Marshalltown, Iowa
U. S. A.

SERVICE

and "THE COVENTRY" Noiseless Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Noiseless Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

BABBITTS

Hoyt Metals have been used with great success for many years.
Put them to the test and you'll soon see a difference in your babbitt cost.
All elements entering into our mixtures are carefully refined and put together in such proportions and in such relation to each other that the best possible alloy is secured for the work for which it is designed.
Annual sales over $5,000,000.

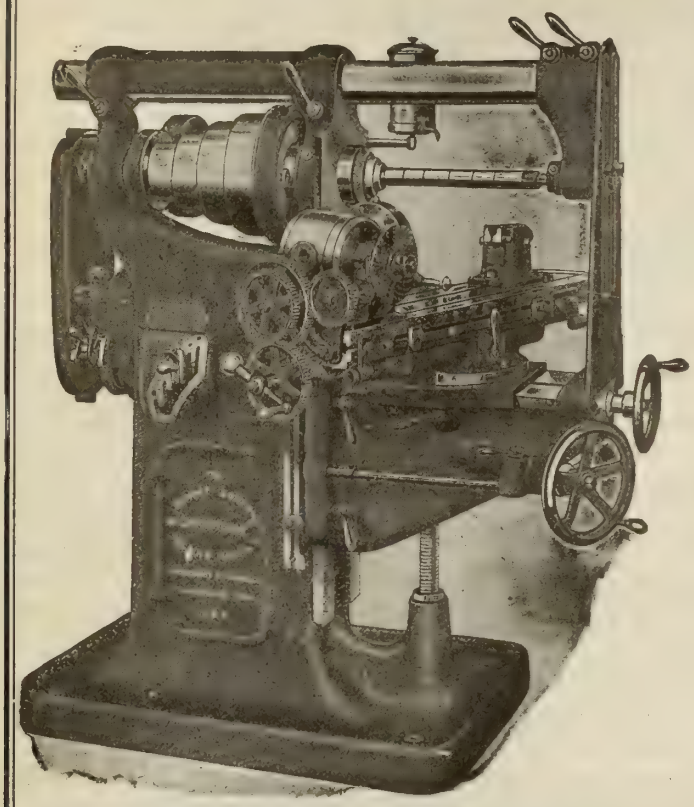
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Foss QUALITY Foss SERVICE Foss

Foss

The Distinctive Rigidity

of the "Mueller" Radials, one-piece, patented column, reinforced with four internal webs; and the long bearing of the arm of this column assures accuracy at the extreme traverse of the spindle even when the arm is at the top of the column. Combination positive, and friction feed, low or high speed friction reverse, unusual operating convenience and other advantages, combine to make it both popular and profitable on a wide range of operations.

One "Mueller" in a plant-brings us repeat orders as fast as the expansion of business warrants. The record of each "Mueller" ordered makes the user want more.

Order your MUELLER from *Foss*

You'll get a remarkable combination of quality and service and our own guarantee of absolute satisfaction or money refunded.

Write for full details.

Purchase the Products of Canadian Mills

TO uphold the Glory we have jointly earned—to honor our noble dead—to comfort the wounded, and extend to the men returned the hand of prosperous welcome, we must cast aside all forebodings and face the future with unbounded courage and confidence and, without a shadow of doubt, declare to the World that this Nation, which was so quickly and successfully transformed to a War basis, can be depended upon to revert to Peace conditions with equal success. The buyer and seller must recognize their duty to the Nation and co-operate fully to the end that all products that can be produced in Canada by Canadian workmen shall not be purchased elsewhere.

OUR Duty is plain; Canada with Canadian labor and capital can produce, manufacture and distribute products sufficient to keep the wheels of industry turning to the limit. The song of Prosperity and Happiness should ring out all over the land. Let us sincerely pledge to the extent of our needs, to purchase materials produced in Canada by Canadian Workmen, and the result of our efforts will return to us the Blessings of a Prosperous and Happy Nation.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material. Motto: "Quality and Service."

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:—

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5 x 5/16"
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3¾ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine Cast Foundry, Malleable and Basic.
Sulphate of Ammonia.

NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

BRIDGEFORD

You Can Rely on BRIDGEFORD Lathes

Pace setters for twenty years in the heavy duty lathe field, BRIDGEFORDS can be depended upon absolutely. It would be like painting the lily for us to use the word "best" in connection with BRIDGEFORDS, but we are prepared to show you how you can increase production with BRIDGEFORDS.

Baldwin and American, in the locomotive field—New York Central, Pennsylvania, Southern Pacific, Santa Fe, in the railroad field—Cambria, Standard Steel Car, Bethlehem Steel, Standard Oil, International Harvester—all of these names are on our customer list. They are only a few of the prominent ones, though.

Let us send you a list of installations near you. A Catalog? A Salesman? Specifications? A word from you will bring either.

WILT

HIGH SPEED AND CARBON TWIST DRILLS, REAMERS AND MILLING CUTTERS

Quality Tools a Vital Necessity

Where there's a WILT—There's the way

Equip your plant with modern tools of the best quality. It is the vital necessity of the day to Manufacturers. Competition of the present and in the future demands it.

For your drilling, reaming and milling cutter operations, choose *WILT High Speed and Carbon Drills, Reamers and Milling Cutters.* As compared with any ordinary tool they cut faster, more accurately, require less power, require less re-grinding and give longer service—and they cost no more than ordinary tools.

Put them to the test—you'll find them best

War Record Not Made Public

The "Whitney" Special Quality "Type M" Chains

made a great showing during the war years 1916-7 and 1918.

Our tests and demonstrations were made on prominent 8-cylinder motors in service on a large number of cars in the State of Connecticut.

During this long period not a single "Whitney" Chain or Sprocket had to be replaced and the condition of every Drive has been pronounced remarkable.

One Drive recently examined had given over 35,000 miles' service and both Chains and Sprockets were in such perfect condition that they appeared good for more than double that record (Sprockets having no adjustment).

The links of this SPECIAL CHAIN have finished faces and reamed holes, and the smooth faces do not damage the Sprocket teeth.

Our war contracts were such that we did not announce this SPECIAL CHAIN until after the conflict was over.

Accuracy

THE steady, even, smooth delivery of power through Link-Belt Silent Chain Drives hold constant the deflections in the machine parts with the result that the tool cuts away the metal without the tearing and chattering that occurs with the shock of high-speed gears, or with the creep and slip of leather belts.

This makes possible a greater degree of accuracy when finishing parts to a fine precisional standard and also provides a better finish.

Link-Belt Silent Chain Drives also increase output about 20%, reduce power required about 20% and increase the service obtained from cutting tools from 4 to 10 times. They are "flexible as a belt, positive as a gear, more efficient than either". Send for our Machine Tool Drive Book No. 312.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

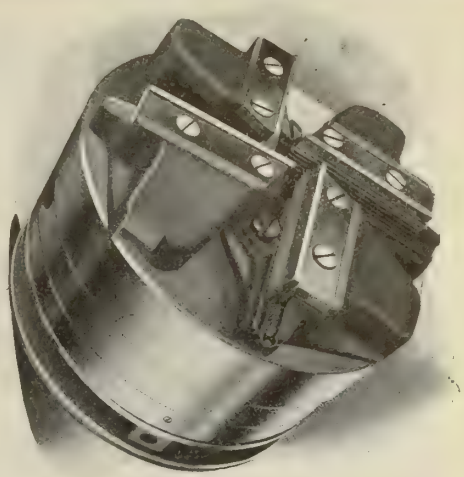
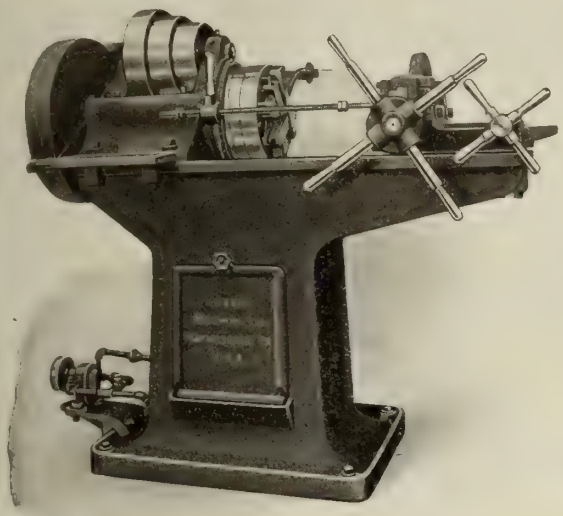
"No Trouble to Make Them as Fine as Lathe Chased Threads"



said the user of Landis Threading Machines and this is not astonishing when you consider that the design of the Landis Die is but the combination of four lathe tools.

This design permits the chaser to be ground to suit the material being threaded whether it is iron, steel, brass, bronze, etc: In this manner an ideal cutting condition is obtained and the resulting threads cannot help but be accurate and well finished.



The chaser is tangentially disposed to the work and is located on a centre line. This means no drag, but instead a free cutting condition which permits of exceptionally high cutting speeds.

Apply the time-proven lathe tool principle to your threading by installing the Landis Die Head or Machine.

Details upon request.

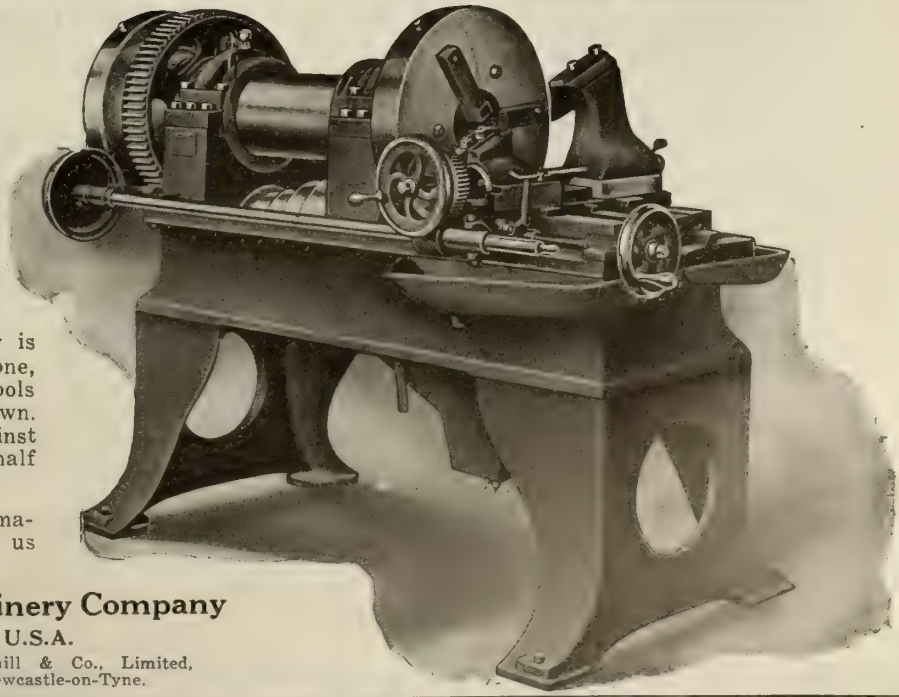
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines

TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.



Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and do twice the work.

You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

The Hurlbut, Rogers Machinery Company

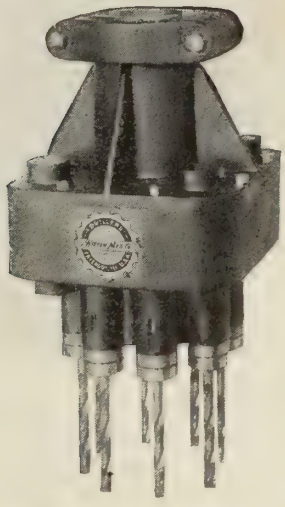
2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time cost.

GALT - ONT.

Do Your Castings Cost Too Much?

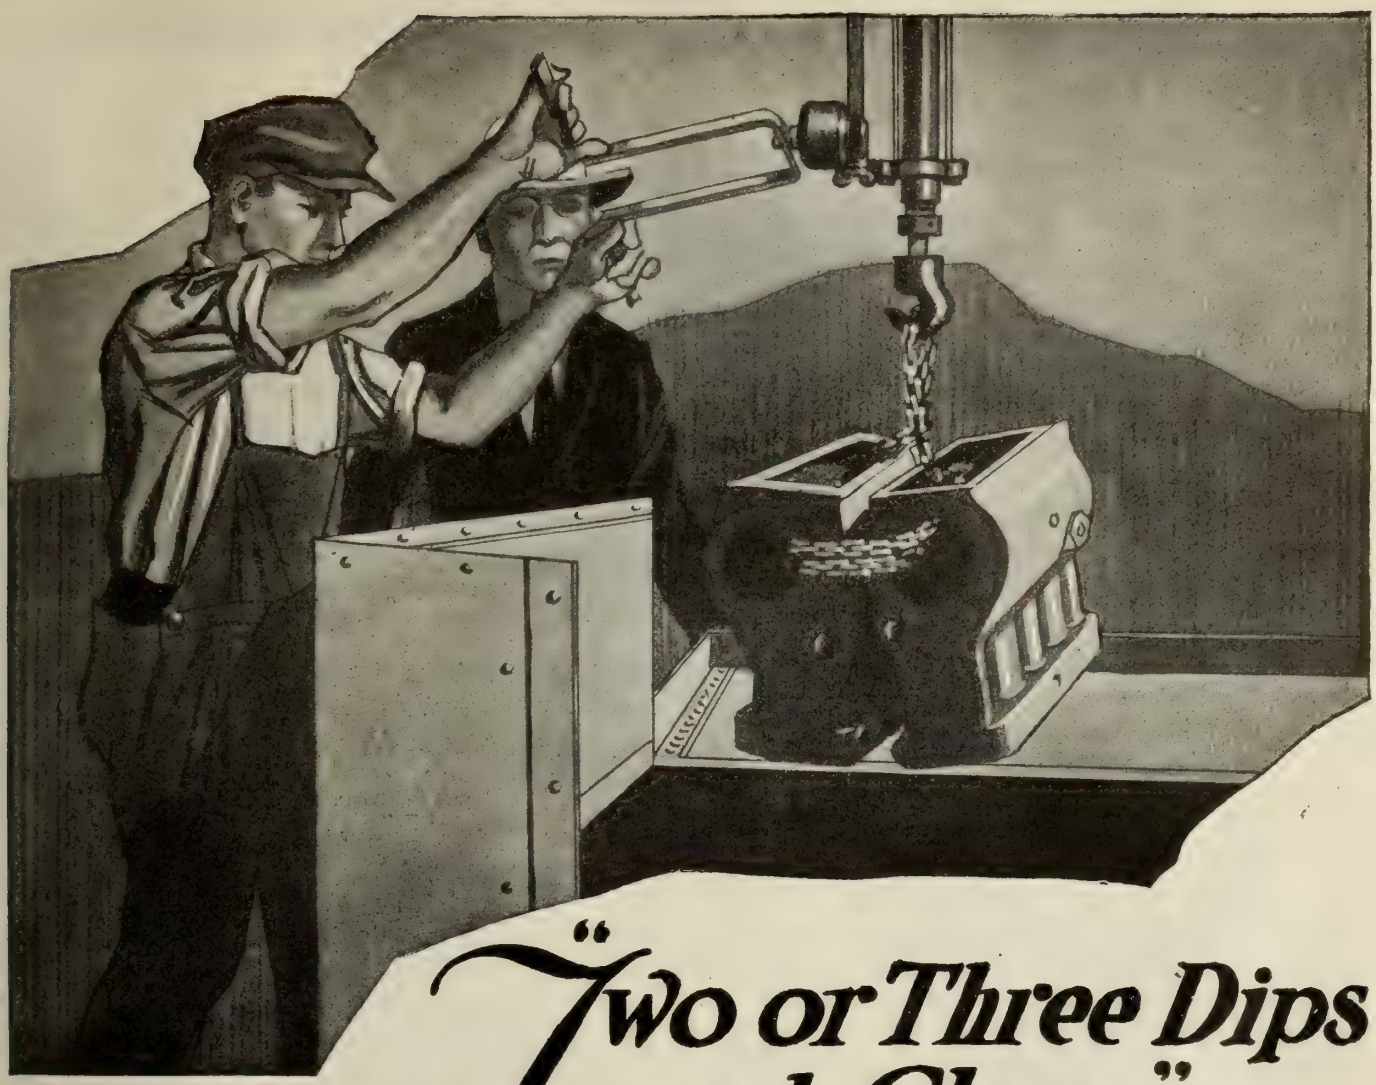
A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US



"Two or Three Dips —and Clean".....

"Two or three dips in the Oakite cleaning tank, and the cylinder blocks are clean.

"We use 4 ounces of Oakite to the gallon of hot water for the cleaning solution.

"Oakite keeps the cleaning department on time. It speeds up the work—and the motor parts come through *clean.*

"No more come-backs from the assembling room since we began using Oakite."

This Advertisement is one of a series based on actual occurrences. W. W.

Confidence

CLIPPER belt lacing has the confidence of American manufacturers. A complete list of Clipper users would include the leaders in every line of American industry. We are proud to be able to count among our customers the following nationally known manufacturers. It is needless to say that none of their plants lack anything that will make them efficient to the last degree.

Waste has been reduced to the minimum. The saving of time has been made the study of experts, with the result that they have adopted Clipper belt lacing.

It is not an exaggeration to assert that Clipper belt lacing predominates in all the manufacturing centers of the world.

The Clipper Belt Lacer
Laces a Belt in Three Minutes

Any machine workman can lace a belt with the Clipper. The low cost of the Clipper makes it possible to maintain Clipper equipment at convenient points around the plant.

The Clipper makes a durable joint—one that pulls better and is safer—is flush with the belt on both sides and is more flexible than the belt itself.

The Clipper goes to you for free trial. It is perpetually guaranteed where Clipper hooks are used. The American Museum of Safety gave the Clipper the only gold medal ever awarded for metal lacing. Use of the Clipper in your plant will solve effectively your belt lacing problems.

Some mill supply dealer in every city sells the Clipper

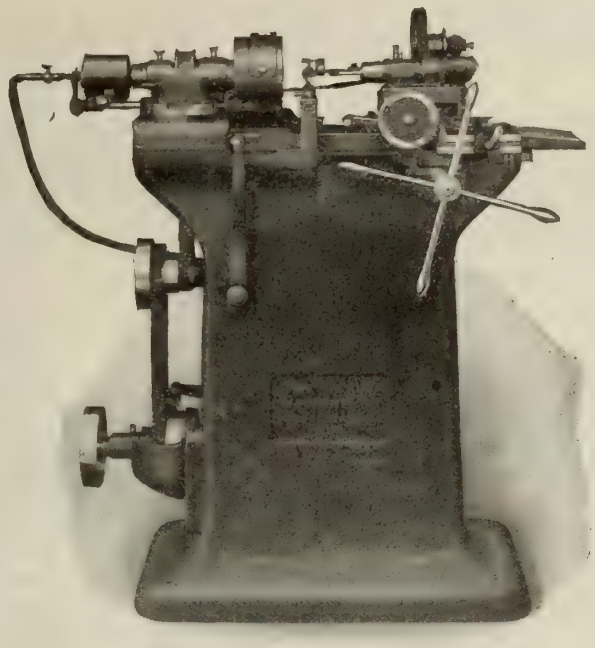
CAPACITY:

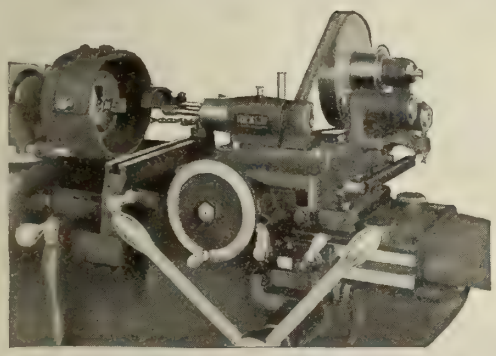
Grinds ¼″ to 2″ dia. x 4″ long.
Collet capacity ⅜″ to 3″ dia.
Swing 6″ dia. with water guard.
Swing 10″ dia. without water guard.
Diameter of workhead bearings 1⅝″ to 1⅜″ dia.
Net weight complete, 1,100 lbs.
Floor space 26″ x 50″.



FEATURES:

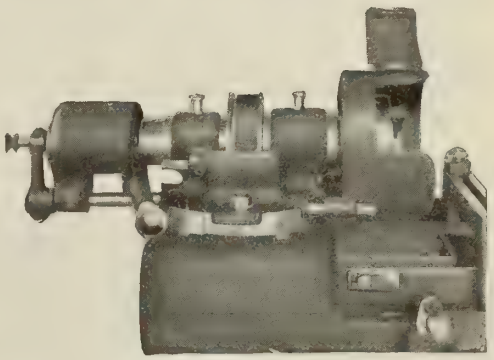
Automatic Brake for work.
Also stops flow of water.
Device for preventing distortion of work when chucking.
New Type 10 wheelhead.
Flexible idler—automatic wheel guard.
Positive stop for table.

FOR GRINDING SMALL SHORT WORK



New design type 10 wheel-head with flexible idler. This combination has proved unusually successful in giving finish and production.

NEW HEALD No. 85 INTERNAL GRINDER



Rigid workhead with massive bearings bolted directly to the base.
Lever which operates quick-acting collet.

A new spindle productive machine for small, short work. While it is simple to an extreme, the following features put it in a class by itself.

It is arranged so that movement of the pilot wheel to the right not only draws the wheel from the work, but automatically applies a brake, stopping the workhead and shutting off water supply.

The quick acting collet operated by a lever and which has a special adjustable compensating device against distortion of any thin work which is being held.

The table is provided with a positive stop accurately covering the travel, enabling the operator to grind up to a shoulder or any given point without danger of over-running. Lever for cross-feed of head is situated so it can be operated with the left hand while the right can still grasp the pilot wheel.

The machine is also equipped with flexible idler — automatic wheel guard — water attachments—and simple, single countershaft.

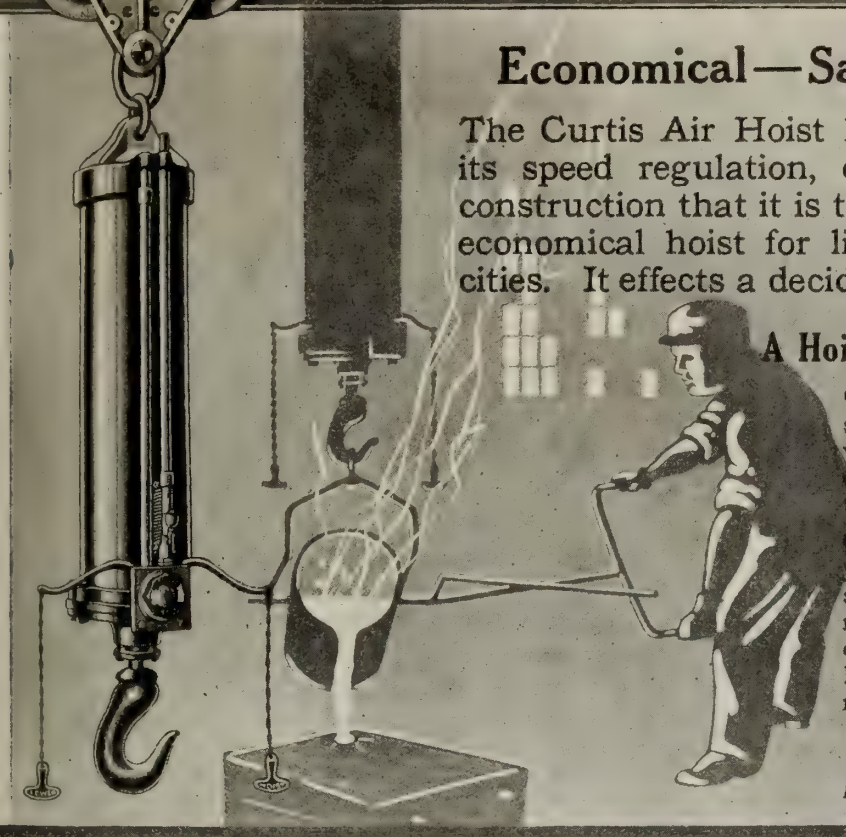
CURTIS *Air Hoists*



Economical—Safe—Dependable

The Curtis Air Hoist has been so perfected in its speed regulation, design and mechanical construction that it is the simplest, safest, most economical hoist for light and medium capacities. It effects a decided saving in man power.

A Hoist to Meet Your Needs

CURTIS AIR HOISTS have been successfully adapted to meet a wide variety of needs in hundreds of the leading industrial plants throughout America.

Our Engineering Department is at your service, ready to study any special conditions you have to meet and recommend suitable equipment. Illustrated descriptive literature and full information on request.

Individuality

A GREAT MAN wrote this: "I'm called away by particular business, but I leave my character behind me." And nobody had to guess whose character it was. Even if the familiar Red Cut label should disappear there would be no doubt as to the character of the steel that remained. More than ever would the quality shine forth in the results when it was worked. Adherence to the highest standard with an unvarying uniformity has placed a well merited reputation all its own on

CUT YOUR CUTTING COST WITH VICTOR Flexibles

The high cost of tools should emphasize more than ever the importance of quality.

The high cost of hack saw blades ought to drive every hand blade user over to the saw that does not break in ordinary hand work.

VICTOR FLEXIBLE HACK SAW BLADES have exactly the same cutting power as the finest All-Hard on the market, and that they cannot be broken in use except by intentional abuse is an undisputable fact—which will represent a saving from twenty-five percent to thirty-three and one-third percent in breakage alone.

Seventy-five percent of the All-Hard blades used in hand frames break before they are worn out. Watch the All-Hard blades in your own shop and see the enormous amount of breakage—then use VICTOR FLEXIBLES and note the economy.

VICTOR SAW WORKS LTD - HAMILTON, CANADA

Standard the World Over

"THE RACINE"

HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

Racine Tool & Machine Co.
Melbourne Avenue - RACINE, WIS. U.S.A.

To cut down the cost per cut

A Matter of Teeth

The efficiency of a hack saw blade depends almost entirely upon the rake, the "set," and the pitch or number of teeth to the inch.

There's no overhanging "hook" to the teeth on a Starrett blade. With proper adjustment of weight or pressure, they'll cut just as fast on the last cut as on the first. The teeth are uniform in shape, "set" and spacing. That's why every blade in a box of Starrett saws cuts alike.

Starrett Hack Saws are made in varying pitches or number of teeth to the inch, from 10 to 32, according to the work they are intended for.

Different kinds and shapes of metal need different blades for economical cutting. Get Starrett blades, use them according to the Starrett Hack Saw Chart and watch your cost per cut decrease.

Write for Catalog 21-"3". It's free

SAVED

In number of cutters used..... 66 2/3%
In take-down time..... 66 2/3%
In grinding time..... 66 2/3%
In setting-up time..... 66 2/3%

This is the record in another competitive performance of

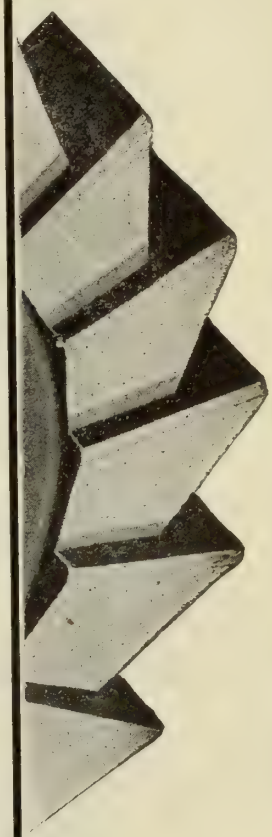
DAVIDSONIZED
HIGH SPEED STEEL TOOLS

Here are the facts as stated by the user of the tools, one of the best known big production plants (name on request):

"Up to the 12th of this month, there have been milled with these cutters 4,296 pcs., and the cutters are still in good condition.

"In competition we have so far used three other pair of different make cutters, all of which it was necessary for us to replace.

"We certainly are gratified at the wonderful performance of your cutters."



What It Means

On the face of it, a cutter which will outlast three others on the same work is worth three times as much.

But this is only a fraction of the advantage gained by this shop through the use of DAVIDSONIZED Cutters. Here are the other important items:

Increased production through gain of two-thirds the time formerly devoted to take-down and setting-up.

Reduction of overhead per piece through increased production.

Saving in labor item through reduction of grinding time.

Gain in good-will through better deliveries.

You, too, can save on all of these items by changing to Davidsonized Tools. The actual amount of saving will vary according to the nature of your work, but it will be big enough to interest you, whatever the conditions. Write for further particulars or ask for a representative to call.

Graton & Knight
Standardized Series
Leather Belting
Tanned by us for belting use

Triple Insurance

A Belt is a beast of burden that can spill a large part of its load without your eye perceiving it.

Here is a belt travelling at a speed of more than a mile a minute. It operates completely around the pulleys 70 times every 60 seconds. At more than a revolution per second, think how even little leaks would foot up a big total if this were not the proper belt for the work to be done.

All Graton & Knight Standardized Series Leather Belts give triple insurance against power leaks because, first, they are made of leather, the one belting material that has the right degree of elasticity to give and take up its tension, and the best of pulley-gripping qualities. Second, this leather is tanned in our own tannery, specifically for belting purposes. Third, our belts are graded into a Standardized Series which includes belts built specifically for every power transmission need. Each is standardized in its manufacture and standardized for its work.

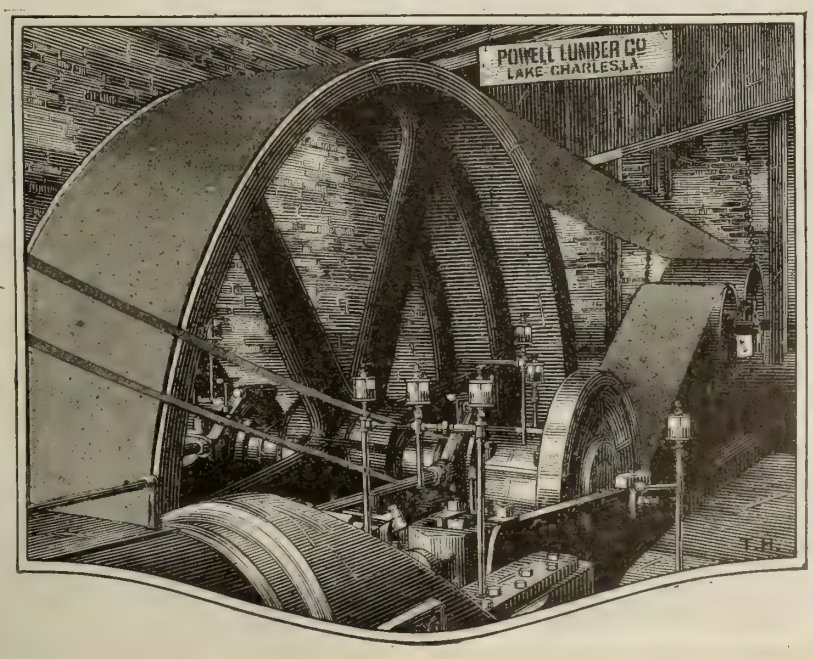
Selecting the proper belt and judging of its efficiency is not a job for guesswork or for the naked eye. It is a true engineering problem. Many of the best belted plants ask us to specify the belting for every pulley drive. Try the plan yourself. Then, when buying, call for "Graton & Knight——Brand or equal." This won't commit you to buying our belts. It will put your buying on the one basic consideration—the work to be done.

Write for Book, "Standardized Leather Belting"

CANADIAN GRATON & KNIGHT, LTD.
Montreal, Canada

Canadian Representatives: The Canadian Fairbanks-Morse Co., Ltd., St. John, Montreal, Ottawa, Toronto, Hamilton, Quebec, Calgary, Saskatoon, Vancouver, Windsor, Winnipeg, Victoria

By means of standardized methods of grading and manufacture, together with extensive investigations in our Engineering Laboratory, our Engineers are able to specify the correct belt for a given drive. Tests show that a 14 to 16 ounce belt should be rated at not more than 90% of the capacity of a 16 to 18 ounce belt. Consult our Engineering Department.



Here is a 34" Gra-Knight 3-ply Belt 82½ feet long. It was installed in December, 1915, in the plant of The Powell Lumber Co., Lake Charles, La. 14 ft. Drive Pulley, 136 R.P.M. 52" Driven Pulley. Belt Speed 5900 F. P. M. 443 horse power. The cost per horse power per week to date is 1 1/3 cents with several more years service to come.

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 54A

SOME FINE POINTS IN GRINDING

IT HAS BEEN BROUGHT to our attention that many of our operators of grinding machines to-day neither realize the possibilities of grinding nor of what vital importance it is to treat both the machine and grinding wheel with care and "respect."

A machine using a very wide wheel, say 10 inches or 12 inches, must have great rigidity and at the same time be capable of producing refined work. Imagine the forces present when a wheel weighing 150 or 200 pounds revolves on a spindle in plain bearings at 1,000 to 1,200 revolutions per minute. There must be accuracy to keep this spindle in perfect alignment so that the face of the grinding wheel will produce an absolutely straight cylinder, and the weight required in the base of the machine and the wheel slide to absorb all vibration caused by the revolving mass must be ample. Another factor that must be borne in mind is the resistance which is offered when the wheel is brought in contact with the work, as small particles of a very hard material are removed at an extremely rapid rate. It has been calculated that on a wheel 24 inches diameter and 4 inches wide there are 1,860,171,000 cutting particles coming in contact with the work each minute. The spindle bearings must be so adjusted that the boxes will be quite hot when the machine is in operation; in fact, a temperature of about 140 degrees Fahrenheit is desirable.

Limits on the work being ground of .0005 inch are very common, those of .00025 inch quite common, and in some cases requirements are so exacting that less than .00025 inch is demanded. It should also be borne in mind that when the work is reduced .00025 inch on the diameter the massive slide carrying the wheel spindle and the grinding wheel moves forward only half of this distance; in other words, .000125 inch. If it were possible to split a piece of tissue paper into twelve thicknesses the thickness of one of the resulting pieces would represent the motion of the wheel slide when the grinding wheel removes .00025 inch from the work. Bear in mind that this accuracy must be maintained not only where very small cuts are taken, but also under conditions where the object is to grind off as many cubic inches per minute as possible.

What is the Future of the Aircraft Business?

Will There Come a Time When Airplanes Are as Common as Automobiles? Peruse This Story and Learn How One Canadian Concern is Pioneering the Aircraft Industry

By J. H. MOORE, Associate Editor Canadian Machinery

WE hear in these post-bellum days vague prophecies of the future of the airplane. This is especially true of England, where the chief aim and object of those interested seems to be to secure undisputed supremacy of the air.

But in reading of these developments in other countries, we are often apt to forget our own shores, giving no credit to the efforts of those at home.

In fancy we hear some readers remark: "What developments are proceeding in the aviation line in Canada?" which prompts the remark: "That truly it is often the most deserving happenings that get the least publicity."

Not many miles from Toronto, at the already well-known spot named Leaside, there is proceeding one of the most wonderful ventures imaginable.

Of course, readers of CANADIAN MACHINERY remember quite well how Leaside became famous during the war time, with its munition plant and aviation field, and it is of the latter we wish to speak.

On the familiar ground where once the aspirants of Canada's aerial force looped and dipped, there now rests a peace-time aircraft industry, known as the F. G. Ericson Aircraft, Limited.

At the head of this concern is F. G. Ericson, himself (whose photograph accompanies this article), a clear-thinking individual, who talks of the aviation game—not as a game—but as a coming business, with practical knowledge of the industry to back it up. From the year 1911 he interested himself in aircraft, foreseeing its wonderful possibilities, and from this to 1913 was engaged in various phases of this interesting work. From 1913 he was connected with both the Curtiss people and the Canadian Aeroplanes, Limited, in the position of chief engineer in each case, and was also sent out to England and France by the U. S. Government to investigate aircraft conditions as practised on that side of the water.

At the cessation of hostilities the aircraft business looked as if it was about to die a sudden death (at least as far as Canada was concerned), but it was at this point that the firm convictions of Mr. Ericson held sway.

With certain business partners he purchased from the Imperial Munitions Board five hundred machines for resale to individuals, companies, or Governments in Canada, and the United States.

FIG. 1.—F. G. ERICSON, IN THE UNIFORM HE WORE WHILE ON DUTY FOR THE UNITED STATES GOVERNMENT.

This meant an investment on a large scale, and required real courage on both his own and partners' part, to stick their hands in their jeans for the real cash to purchase such a large quantity of machines, but they did it.

This, on top of the fact that they were keenly aware of the fact that even after they had the machines there still remained the task of convincing a doubtful public of the possibilities of flying and its advantages. They knew only too well that the average person looks on flying as a good way of committing suicide within the law, and that not only must they prove to the skeptics that flying was safe, but they must also instil the desire to own a machine.

As Mr. Ericson puts it, "We hope to correct the erroneous impression that people have regarding the aviation business being a dangerous one. The flying proposition is just as safe, if not safer, than crossing the corner of King and Yonge streets, providing you learn the business thoroughly, keep your head, and do not attempt foolish stunts.

Connected with Mr. Ericson are Messrs. C. Pearson and F. Webster, both of whom have also been connected with the Curtiss and Canadian Aeroplane Cos. before entering this latest concern, so that, if real, practical ability means assured success, this new industry is well equipped for bigger and larger things.

But to proceed with the details of the building up of this commercial aircraft industry.

Taking in a total acreage this firm covers about 400 acres, of which 100 is at Armour Heights and 300 at Leaside. At the Leaside field they have nine hangars and twenty-seven other buildings, including a dope shop, store room, repair shop, restaurant, fire hall, and a large three-storey building containing stock rooms, drafting rooms and offices.

These statements prove convincingly that this business is in the field to stay, and, if one may be allowed a prophecy, it will.

The whole affair has been gone into, not hastily, but with foresight and careful thought. At present the chief aim is to create a demand; later, extensive production will follow. At present the

designing staff are experimenting in various ways to increase the usefulness of the machines to civilian purchasers and in Canadian J.N.4, which is the standard model being built by this company, all such points have been kept in mind.

Mr. Ericson in designing this machine mentions that stability was aimed at above all other points. This feature makes for safety. Already he has transformed a two-seat machine into a three-seater with splendid success. The pilot in this new design sits behind the two passengers. This machine he has termed the Ericson Special Three.

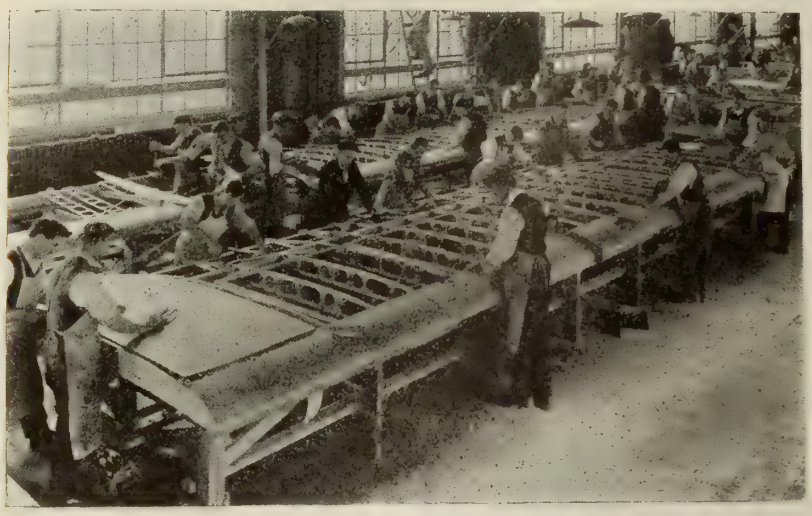

FIG. 2.—BUILDING UP THE WINGS OF THE J.N.4 MACHINE.

To give readers some idea of the construction of the wings on this J.N.4 plane, let us refer to the photo illustrating this work going on.

These wings are made practically of wood only, the only metal being the holding and fastening clips. Of course, the covering is made from linen of Irish first quality material, or from American cotton made specially for this aircraft work. This material is first stretched and fastened, later being painted over with dope, as it is called, until the complete wing is taut, and on being hit sharply with the finger issues a sound not unlike the skin of a drum. Four coats, as a rule, of this dope is sufficient. Four men and an inspector generally work on each of these wings, the inspector attending to various wings within his department. This mention of inspector brings up a very important point in this industry, namely, the absolute necessity of a rigid inspection system. Human life hangs on the words of the inspector as to whether he says O.K. or not, and realizing such to the full, no work is passed unless perfect in every way. Each and every portion, making up the plane, passes rigid test, then later a complete test is made which will be explained further on in the article.

One type of engine is at present used in these J.N.4 machines, which is known as the Curtiss OX5 motor. These engines have eight cylinders and develop 90 horse-power at a speed of 1,400 rev. per min. The swing a propeller 8 ft. 3 in., tip to tip. The general appearance of this motor is easily seen by looking at Fig. 3.

The Preparing of Propellers

The preparing of these propellers is a study in itself, so we will content ourselves with a brief description of the operations involved. Usually these propellers are made of finest quality quarter-cut white oak, laminated together, but walnut mahogany and birch are also used. Eight or nine laminations are generally used in the average propeller, each being carefully inspected before finally glued together. A special high test animal glue is used for such work. Of course, previous to any work being done on these propellers, all the wood is thoroughly kiln dried to remove all moisture, in order to prevent possibility of shrinkage. When we say that it takes about one month and a half to complete one of these propellers, readers can see that great pains is spent to make them perfect in every way. Otherwise they are useless. In some cases these propellers are made of two or three kinds of wood, but never more than three kinds at least over in this country. In Germany, however, they are not so particular, as they use as high as six kinds in one propeller. One particular propeller which the writer looked at closely had the following woods laminated together: mahogany, oak, birch, ash, beech and maple. Some combination, and yet it looked a mighty business-like article, and, according to various authorities, delivers the goods.

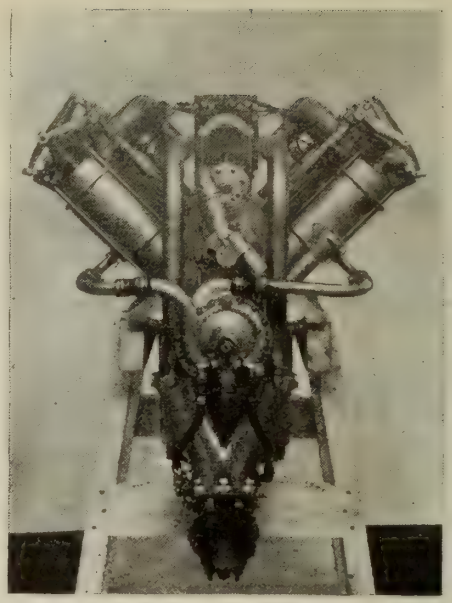

FIG. 3.—AN END VIEW OF THE AIRPLANE MOTOR.

Captured German Planes

Speaking of Germany brings us up to the point where we can speak with justifiable pride of the war trophies now resting at this field we speak of. Here are several types of German machines, which will do no further damage to our airmen, who so well coped in battle with them. Chiefly among these trophies is the machine already well known as the Fokker. One of these is shown at Fig. 4, in its war paint of camouflage. Seated in this machine is none other than Lieut.-Col. Bishop, V.C., D.S.O., M.C., C.D.F.C., Canada's famous airman, together with another airman of well-known renown, namely, Lieut.-Col. Barker, V.C., D.S.O., M.C., D.F.C. Certain of these machines are to be exhibited in flight over the exhibition, while others will be placed at stationary exhibits for the onlooker to gaze at to his fill. Note the German crosses under the wings on this machine shown on Fig. 4.

FIG. 4.—A CAPTURED FOKKER MACHINE, WITH LIEUT.-COL. BISHOP, V.C., D.S.O., M.C., C.D.F.C., IN THE PILOT'S SEAT.

Other types of German machines now at these hangars are the Roland and Junker. The former is a beautiful machine, with long graceful curves, almost

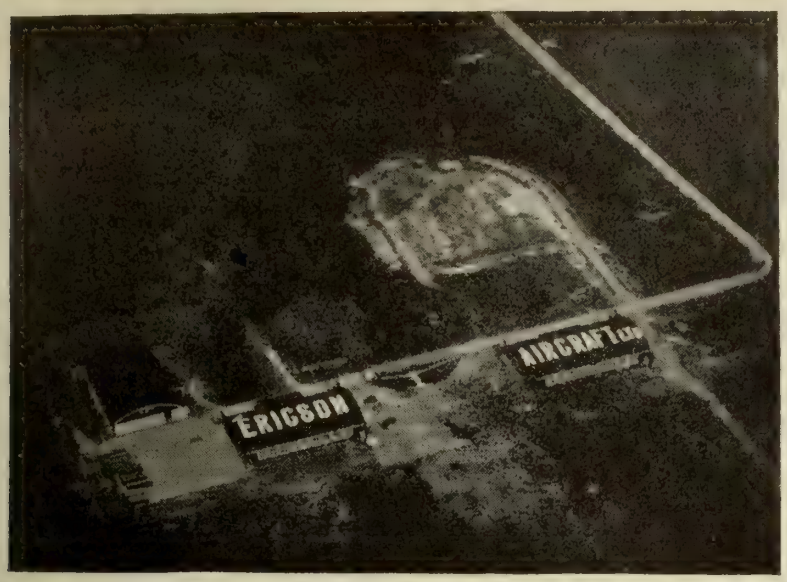

FIG. 5.—LOOKING DOWN ON A PORTION OF THE FLYING FIELD. NOTE THE BOXES ON THE GROUND CONTAINING CAPTURED GERMAN MACHINES.

like a huge fish. It is also colored in a lovely manner and looks anything like the prey seeking air carrion, which it proved to be in war time. This machine has a remarkable speed of 125 to 130 miles per hour. A Benz motor supplies the motive power for this machine; two machine guns also form a part of its equipment.

The Junker plane is of an entirely different nature, the complete engine as well as the pilot and observer being covered in with 3-16 in. armor plating. The wings and control surface are covered with corrugated sheet aluminium. This machine is also equipped with machine guns and receives its motive power from a Benz 260 h.p. motor. This type of machine was used for trench straffing, flying at low altitude and at a speed of 60 to 70 miles per hour.

At Fig. 5 we illustrate how three of the hangars look for an airplane at a height of 3,000 feet. The two hangars to the left of this photo are filled with German machines, while the boxes on the ground also contain some of these war trophies. It is interesting to note how clearly the name of this firm appears at such a distance.

Fig. 6 shows another remarkable aerial view from a height of about 5,000 feet. Here we see a picture taken in winter of a portion of country surrounding Leaside. By careful study Leaside can be seen in the background towards the right-hand portion of photo. A study of this picture will bring out clearly the advantage of aerial photography.

Speaking of winter brings to the writer's mind a statement made by Mr. Ericson, which is well worth repeating. "You ask what proof I can give you to the effect that flying intelligently is perfectly safe," he remarked. "Well, I'll tell you," and then he told the following facts:

Many of the machines which we purchased were at other points throughout the country, and, of course, the easiest way to do was to fly them into our headquarters here. We did so with not a single accident. We have had machines arrive in snow storms, hail storms and even when both rain and snow was falling, which is a nasty combination, yet no trouble. We even had men landing as late as 9 o'clock at night, when we built fires to guide their landing. "In some cases they landed with a 45 mile gale blowing," he said, but the writer was convinced without further details.

"Do you have much engine trouble," was another query popped at one of the officials of this concern, but the answer was readily forthcoming.

"We have no trouble, because we see to it that every engine is thoroughly tested. Each engine is placed on a block testing stand and tested in the following manner: For the first hour and a half the engine is run at 300 r.p.m. It is then stopped, oiled and inspected, then started once more on another 1½ hours run, at maximum speed of 1,400 r.p.m. A final inspection is now made and the engine must show absolutely no results of the strain. Providing it proves O.K. it is now installed in the machine and once more tested on the ground. This proving satisfactory, the machine goes on its trial flight. Of course, the other portions of the plane have all been thoroughly tested previously to this stage."

When up on its trial flight the machine is purposely put through all sorts of manoeuvres to place every strain on it, which would, or even might occur in an actual unforeseen condition. For instance, if by some means or other an aviator should come close to a tree, as shown on Fig. 6, he must make a vertical bank in order to miss the same. In this photo we see the machine just clearing the tree and starting to rise again. Such a stunt, of course, places considerable strain on the machine, which is what is wanted, for, on returning from its flight, the whole machine is gone over thoroughly before the final O.K. is placed on it as suitable for flying purposes.

The Staff

And now a word of the staff which devotes its time to this interesting work. Fig. 7 illustrates the staff as they appear en-masse. Approximately 200 employees are engaged on this work, and they co-operate as one big family.

To illustrate this point, let us quote what happened at what we believe is the first aerial picnic ever held:

On July 24th, with the aid of his executive staff, Mr. Ericson gave a picnic at the field for the benefit of his employees. The regular sports were held, but in addition to these regular sports, passenger carrying and exhibition flights were held, each employee desiring a flight going up. Five pilots handled the machines, their names being as follows: Capt. McCrudden, Lieut. McCarthy, Lieut. Moore, Lieut. Shiller, and Lieut. Colby.

Over 160 flights were made with absolutely no mishaps and even one lady 78 years of age partook in the flights.

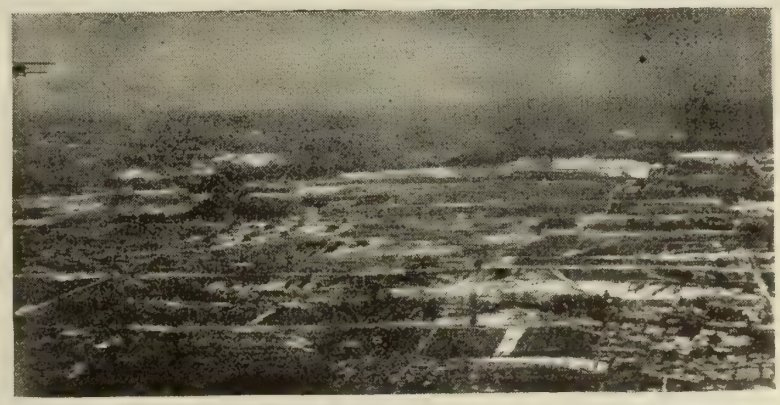

FIG. 6.—A REMARKABLE AERIAL PICTURE TAKEN DURING WINTER—THE WHITE STREAKS, OF COURSE, ARE SNOW.

This particular case caused much amusement, for this lady's son had worked on aeroplane work for 4 years but had never even been up in the air, and his mother thus showing him the way, made him the butt of considerable joking. The employees, after the picnic, presented Mr. Ericson with a handsome library table and chair, to not only show their appreciation for the good time enjoyed, but it also happened to be Mr. Ericson's birthday. This close relationship between employer and employees explains

FIG. 7.—MAKING A VERTICAL BANK, IN ORDER TO MISS THE TREE.

the harmony that exists in this concern.

And now as a sort of a conclusion, let us read what an Old Country air enthusiast has to say of the air business and its possibility. He starts off as follows: "The good time is coming." Every man his own aeroplane. This chap, for want of a better name, calls himself Windstick—so we will let him have his say:

"Why should you not own an aeroplane in the near future? If you can afford a small motor-car, there is nothing impossible about the prospect, when you remember that the best engineering brains in Britain are now busy designing it for you. A little runabout 'plane like this would not require overhauling oftener than once in every two hundred hours of flying, and the work would present very few difficulties to the mechanically-minded amateur. Its maximum speed would not be very high; say, sixty miles an hour. It would be capable of landing at about thirty miles an hour (thus lessening the liability to accident on alighting); as pressed metal would be largely employed in its construction it would be practically fireproof, thus doing away with the worst bogey of the air; and its running costs would work out at about three-pence per mile. (This figure is conservative, and has often been improved upon.)

The £200 Machine

The private driver will keep to the lower lanes of the air, and he will not need to work his engine at full power the whole time, as has necessarily been done in the war. The aeroplane will run for a year with nothing more than common-sense attention. This little machine, as designed (for it has been designed, you know, and flown), will be capable of taking off from the ground in a distance of twice its own length. It will have a self-starter, and the pilot's seat will be cosy, with a few simple instruments to navigate by. If his engine fails, the machine has a long "gliding angle," which will enable him to select a suitable landing-ground, where he can alight easily, insulated from all shocks by cunningly devised springing, and set about the necessary repair, or call up the nearest repair station on his miniature wireless set. He will store the machine at his club hangar for a nominal cost.

The price of such a little craft as this? Now that English factories are organized for "quantity production," and can make duplicate parts of high quality with fabulous speed, this need not be more than—guess?

Two hundred pounds! Just that.

The Week-End Flight

Imagine that your week's work is done, and that you have arrived at the communal aerodrome of the future. The mechanics have unlocked your shed, and wheeled your baby machine out on the grass, where she sways lightly in the wind, as graceful in her gleaming coat of yellow and silver as a bird on a bough.

You step into the comfortable, sheltered cockpit, where no worrying wind can reach you, clad in clothes which are electrically warmed by a tiny fan-driven generator which the wind of your passage revolves. A glance at the controls and the glistening dials in front of you, you press your foot on a button on the floor, and the engine roars into life. Across the sunny grass you speed, the machine hops once—twice—she is off, and you are master of the sky until Monday, which you need not think about!

The machine gains height, there is no vibration, only the pleasant, monotonous whirr of the propeller cleaving its way, and the hum of well-oiled machinery. The hangars below you grow rapidly smaller, the sun glistens on their roofs of corrugated iron, making them look like cubes of sugar. The machine heels over, and you look down the slope of the polished wing at the pretty mosaic of the brown and green earth. Church spires wheel below you as you turn, and the sound of the villages, the shout of a boy, the shrill yap of a dog, drifts dimly up to you.

In a minute it is dark, a thick enfolding moist blanket. You have run into a cloud. Quickly you are out again, and the sun beams with renewed vigor; you can still feel the genial warmth of it. But soon you will have "got your height," then it will be cold, and you will switch on the current that envelops you from head to foot in a grateful glow. You rectify your flight by a map which automatically unrolls before you, and you land when or where you like!

By reason of their swift intuition and light touch women are specially adapted by nature for the control of quick-responding machinery, and who knows but what the commercial fleets of the future will be largely "manned" by women pilots?

Airship Luxury

For staider passengers, who feel no need for haste, and do not feel inclined to go to the expense of a private aeroplane, there will always be the dirigible services. These great "rigid" flying machines, not dissimilar to the modern Zeppelin, but far less unwieldy, and immune from risk of fire, will operate over long distances.

As weight need hardly be considered, they will be fitted and furnished with a view to utmost comfort. You will feel as safe in them as you would in a mighty liner of to-day. There will be no perceptible motion, no pitching and tossing, and the huge craft will glide serenely through the skies with all the ease and confidence of the eagle.

There will be fine saloons with mahogany panelling, dainty tables and wicker-work chairs grouped enticingly on carpets of Utrecht velvet; and through the long windows of unbreakable glass the passengers will be able to drink in the marvellous panorama spread wide

FIG. 8.—HERE IS THE HAPPY FAMILY, WITH THE ERICSON SPECIAL THREE MACHINE, SPOKEN OF IN ARTICLE, SHOWING UP TO GOOD ADVANTAGE.

about them. Through occasional windows let into the floor they will be able to note every detail of a town as they pass silently and majestically overhead. There will be no smell, for the engine-rooms will be far away from the cabin, and sea-sickness, or its equivalent, air-sickness, will be a forgotten evil. *Should* anything by chance go wrong with the machinery, the great ships of the air can hover at anchor until it is rectified; there will be no "forced landings," and fuel can be taken on from ships at sea. Two hundred tons can be carried by such craft with ease!

Far from being over-fanciful, my picture, I am convinced, falls short of the aerial wonders awaiting us in the near future.

While we do not for one moment imagine that readers will agree with the above, still we must admit that all new inventions have advanced as a rule with very rapid strides, so let us watch the future of the aeroplane with keen interest, in the meantime taking off our hats to our Canadian Concern that has had the courage to lead the way on this side of the water.

The Art of Properly Grinding the Twist Drill

Being a Series of Notes and Sketches, Showing How to Grind Correctly Twist Drills, in Norton Grinding Machines. Mechanics in General Will Appreciate Such an Article

A CORRESPONDENT sends some notes and sketches on the grinding of twist drills in the Norton grinding machines. He gives useful particulars about suitable grinding wheels, speeds, feeds, order of operations, production times, and a few necessary fittings special to the job.

Grinding Wheels

For grinding the fluted parallel of taper shank drills or the whole lengths when the drill is parallel throughout the most suitable wheels are Norton 60 grit and N. to P. grade. For grinding shanks, taper or otherwise, in a plunging cut with wheels fully as broad as the shank is long, the most suitable wheels are Norton 46 grit L. grade or 24 grit C.L. grade.

Speeds

The grinding wheels should be run

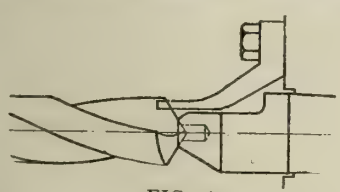

FIG. 1.

at a surface speed of 6,000 to 6.500 feet per minute for both traversing and plunging cut grinding. The workpiece in traverse grinding should be revolved at a surface speed of 60 to 80 feet per minute and for plunging cuts, at 40 to 60 feet per minute.

Machines

For drills of various sizes the most suitable Norton machines are: For drills up to ⅜-in. dia., 3-in. by 18-in. machine; ⅜-in. to 1¼-in. dia., 6-in. by 32-in. machine; 1 5-16-in. dia. and upwards, 10-in. by 36-in. machine. For grinding shanks, taper or parallel, in a plunging cut with wide or "formed" wheel, the 6-in. by 32-in. machine may be used if the shank is under 4-in. in length; but the best results are obtained in form grinding with the Norton 10-in. by 24-in. special purpose machine. The fluted portion should be ground by the traversing method only.

Drivers

A special driver is necessary so that the peg will enter the flute of the drill and leave the round surface clear for the grinding wheel. Fig. 1 shows a simple and effective design which may be attached to the driving plate where a running centre is used. If the drill is very small the driver may be modified for attachment to the running centre. Where a dead centre is used a slight modification would enable it to clear the centre. When the fluted end is ground as a separate operation the ordinary carrier is fixed on the shank end.

Grinding Allowance

The drills should have not less than 0.005-in. to 0.008-in. left on the diameter for grinding, after previous machining operations are completed.

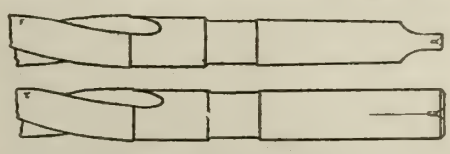
Small Drills

Drills up to ⅜-in. dia. may be classed as small, and generally have straight shanks parallel with the fluted portion. Those as small as 3-16-in. and under should be ground with a running spindle attachment. The full length is ground at one operation at the rate of about 60 per hour, but very small drills take longer owing to the inconvenience of handling them.

Many small drills are made with a slight taper on the fluted portion, the cutting end being the largest. Two operations are necessary with these, and each operation will take practically the same time as grinding the whole drill parallel. Grind the fluted part first.

Medium and Large Drills

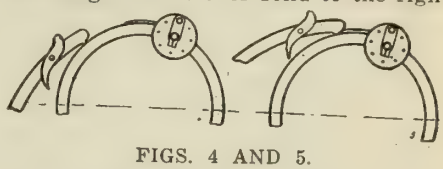
These are generally made in three forms; with round shank parallel with fluted portion as in Fig. 2, with taper shank as in Fig. 3, or with tapered square shank for ratchet or brace use.



FIGS. 2 AND 3.

It is usual to have a recess in both the forms shown in Figs. 2 and 3, and a slightly reduced portion from about the end of the flutes to the recess. There should also be a slightly reduced part in square shank drills. These parts need not be ground; the size of the drill is stamped on one of them, preferably on the smallest, or on one of the flats of the square shank.

In grinding any of these, put the carrier on the shank end. After putting the drill in the grinding machine centres set the left hand reversing dog so that the reversing lever is over solid to the right



FIGS. 4 AND 5.

when the corner of the wheel is over the centre of the recess. If there is no recess and the shank shoulder is larger than the drill, the wheel should just touch the shoulder. Then set the right hand reversing dog so that the table will reverse when the wheel overlaps the job by about an inch.

On starting grinding, bring the wheel forward to left hand end as already defined, and feed straight in to plus 0.002-in. of the required size. Put traverse belt and lever over for the second slowest table speed possible and put in traverse lever, thus removing all but 0.002-in. in one cut. The production rate for this cut should be 27-in. of length per minute on a 6-in. by 12-in. machine and 22-in. on a 10-in. by 36-in. machine.

Immediately this cut has been completed, swing over the two-speed traverse lever (on front of the machine) and finish to size in cuts of 0.0005-in. per traverse. The automatic feed pawl link should be set on the quadrant to give a feed of two notches (0.0005-in.) on each reversal of the table. The carrier can be put on the next drill while the machine is automatically making the finishing cuts. The actual grinding times for grinding the fluted parts of ¾-in. drills of 6½-in. standard length is 30 seconds, and 1¼-in. dia. 9-in. standard length, 40 seconds, both on the 6-in. by 22-in. machine. These times allow for removing up to 0.010-in. to 0.015-in. from the diameters.

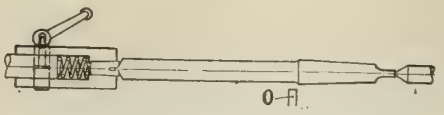
The positions of the automatic feed pawl are shown in Figs. 4 and 5.

Grinding Shanks

The shanks, parallel or taper, are most economically ground in one plunging cut on a Norton S. P. machine. A wide wheel is used, parallel or formed to the taper. The actual grinding time on, for

example, a No. 3 Morse taper shank or parallel shank of about the same length is 30 seconds for removing up to 0.015-in. from the diameter.

It is very often necessary to grind shanks in two operations on account of the slight distortion that occurs on some steels after grinding. This distortion is so slight that it is not appreciable on a parallel unless the gauging hole is very long, when a slight binding would be felt. It is more easily felt on a taper gauge. If it is found that the steel has this tendency, and two operations are necessary, reduce to 0.003-in. above size



at first operation. Lay the drills aside for at least 12 hours and then finish to size as a second operation.

Variation in Lengths

Where the drills as received for grinding are not exactly the same length a quick means of adjustment must be found, so that the shank may be ground at the correct distance from the shoulder. Fig. 6 shows a fitting which has been found successful and sufficient. A spring centre is fitted as shown, and a setting piece o is fixed to locate the shoulder. If adjustment is necessary, slack the spring centre clamp, with the workpiece between the centres, and adjust the shoulder to the setting piece by the tailstock screw. Then tighten the spring centre clamp and adjust the tailstock centre for running.

If good methods are followed throughout it is not difficult to grind twist drills to fine accuracy and in quick time.

Speed Up Production by Systematic Handling

It is a Recognized Fact That Any System Which Will Facilitate the Handling of a Product, Means a Lowering of Manufacturing Cost. Herein is Described One Lamson Method of Handling Goods

By J. H. MOORE, Associate Editor Canadian Machinery

IT is a well-known fact that in a plant of any size to speak of, there exists in some form or other a bugbear which we, in general terms, speak of as industrial leakage.

Industrial leaks are to a certain extent bound to occur in some form or other, for we cannot secure perfect plant efficiency any more than we can secure perpetual motion, but we can, by careful thought, trace the leaks to their source and improve these conditions as far as lies in our power.

When tracing the cost of a product and its existing high cost figure, it is often surprising to find how simple the remedy is. As a rule the trouble boils itself down to three things, namely: machine tool equipment, system of routing, or system of handling.

Generally the first item does not enter into the trouble at all, for in these modern days the up-to-date master mechanic sees to it that his shop is well equipped with the best time and labor-saving machines possible.

Unfortunately many of them stop at this point and do not consider the other two equally important points, namely, the routing and handling of the product.

To successfully reduce the cost of any product one must thoroughly study the course of the products' manufacture, routing the same in such a way that every possible lost motion is eliminated. No unnecessary jumps should be made, but the tool equipment should be so arranged that not only will the work pass along evenly and systematically but there must be no congestion at the various machines, for congestion means time wasted, worry, and added expense.

There was a time when it was considered all right to have hunkies (as we called them) bring us our material in almost any method as long as we got it. Usually these fellows were tall, husky chaps hired at about $1.25 per day, with very little brains more than that they only accomplish the certain task to which they were allotted. Often there was too much work given for each man to do, with the result that before long the work would pile around some particular operator's machine, with the outcome that production suffered and costs went up.

It took considerable time to convince certain plants where their trouble lay, but luckily at a later date they went after the trouble with surprising results.

Numerous methods have been employed, and one method which has improved the handling problem to a wonderful extent is that of the gravity system.

What is the Gravity System?

The gravity system is a series of rollers, which together form a roller conveyor. Each roller is mounted on a ball-bearing, which of course makes each roller sensitive to movement. This system uses the free power of gravity, which, so to speak, costs nothing, for gravity is always on the job at your command.

To quote what particular products can be carried by such a system is impossible, for practically all products having at least one flat surface can be carried direct on one of these conveyors.

To illustrate this system of moving material, let us consider Figs. 1 to 5.

Here at Fig. 1 we see a typical overhead installation, with the gentleman shown in the picture about to pull the handle of the switch in order to divert the product in desired direction.

This is one of the features which make such conveyors of great convenience, for the gravity system is flexible as a railroad track. Depending upon your required direction, the conveyor can be made to suit, and owing to the small space occupied by such a conveyor the

FIG. 1.—NOTE THE OPERATOR MOVING SWITCH, TO CHANGE DIRECTION OF PRODUCT.

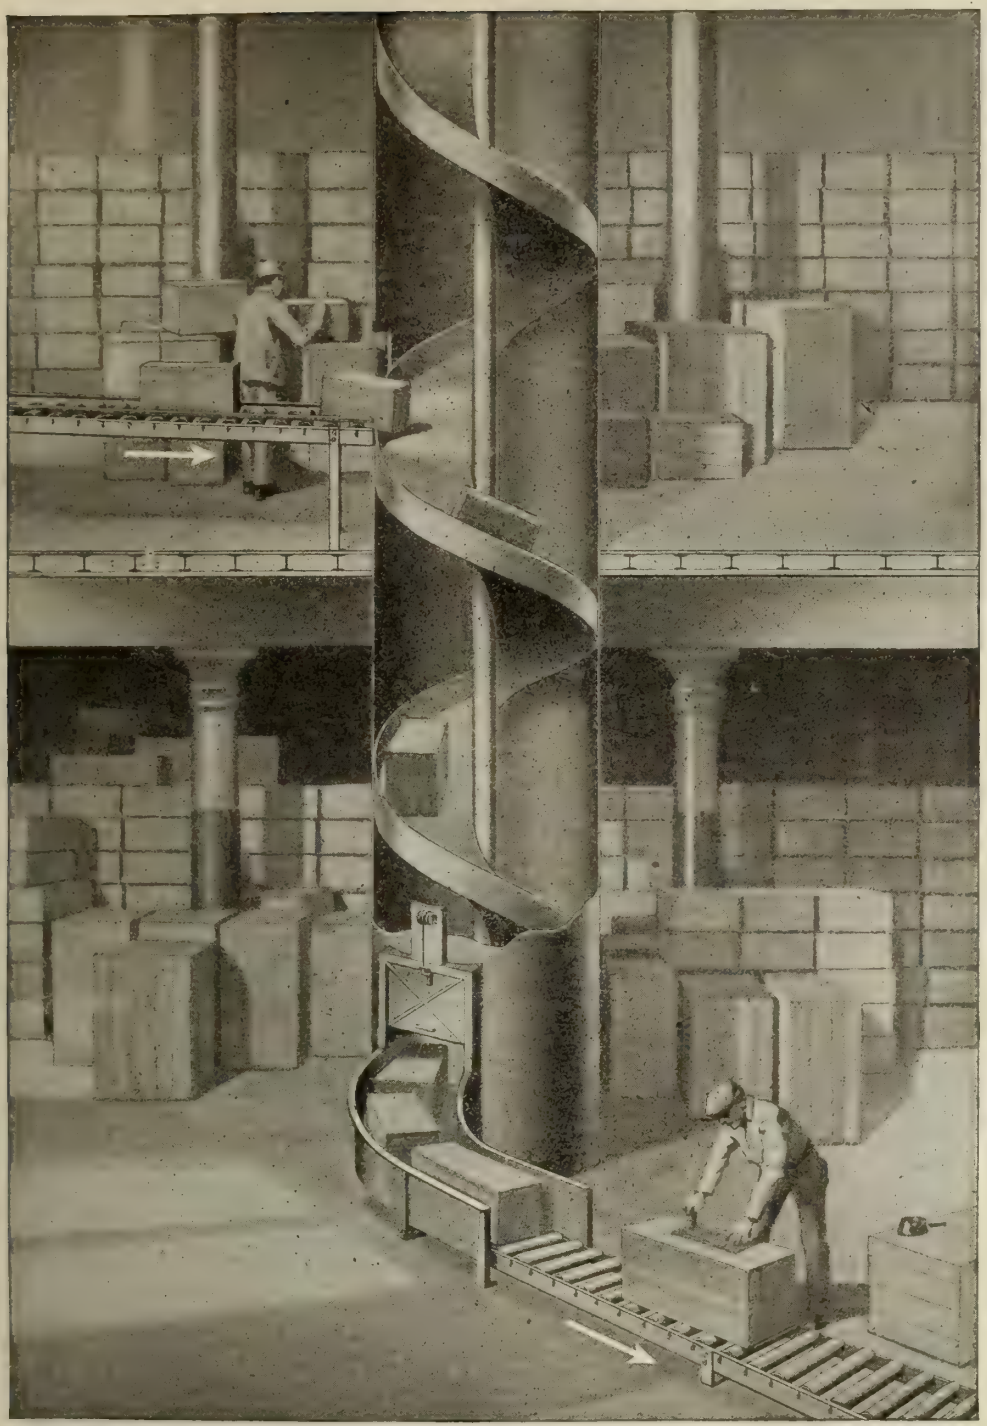


FIG. 2—A GOOD ILLUSTRATION OF A SPIRAL CHUTE BETWEEN FLOORS.

tracks can run between machines, around columns and obstructions without any trouble.

Production from a given floor area is increased in many cases over 50 per cent. More machines can be installed on floors that are clear of stock, while the machines can be kept up to capacity all day long, when conveyors properly placed keep the workmen supplied with materials.

To convey your product from floor to floor is a simple matter with the gravity system. A spiral conveyor or chute is arranged as shown at Fig. 2. The remainder of operation is self obvious. Place your product on the gravity conveyor on one floor, when it will enter the chute, descend to the desired floor, and once more be carried on to a further operation.

Use in the Machine Shop

To state all the uses of this type of conveyor in the machine shop would take a volume, but as one example, let us study Fig. 3.

The conveyor shown is used in the plant of the Domestic Engineering Company, Dayton, Ohio, for transporting their Delco light outfits to the shipping platform. The crates are bolted to the skids as the machines pass along the conveyor. This method naturally saves time and labor. The shipping address is also stenciled while the product is, so to speak, on the move. The crated machines are then conveyed direct to the waiting car or delivery truck as the case may be.

Use in the Foundry

Let us now consider two illustrations in the foundry. Fig. 4 illustrates to good advantage how separate portable sections of conveyors can be used with splendid results outside the plant altogether. Here we see the men busy unloading pig iron from cars at the plant of the Saco-Lowell Co., Lowell, Mass. By such a system they have been able to save more than half the labor in unloading and piling cars. Of course the conveyor, being of portable construction, can be shortened or lengthened as desired. The benefit of this is self apparent, so no further mention on photo is necessary.

The fifth and last picture in this article shows the same style system installed inside the foundry.

In this foundry, castings, as they come from the moulds, are carried on pallets or in trays to the sand-blast or pickle room. The conveyors are so arranged that they can be moved about the foundry wherever they are wanted. Flasks are also brought by conveyor from the storage to the moulding floor. Cores are carried in the same way from the core ovens to the foundry floors. Other uses for this type of conveyor are inumerable, but these two examples as already illustrated and described will suffice.

To summarize briefly, it might be said that the gravity system of conveying has proved by its results to be a direct killer of high handling costs, so that should you be contemplating some system of transporting your product in an efficient manner, it will be wise to consider this style of movement.

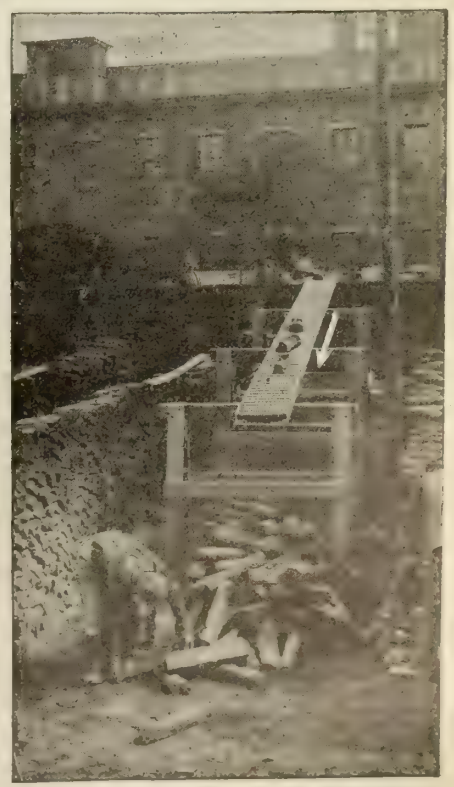

FIG. 4—GET RID OF YOUR CAR UNLOADING PROBLEMS IN THIS MANNER.

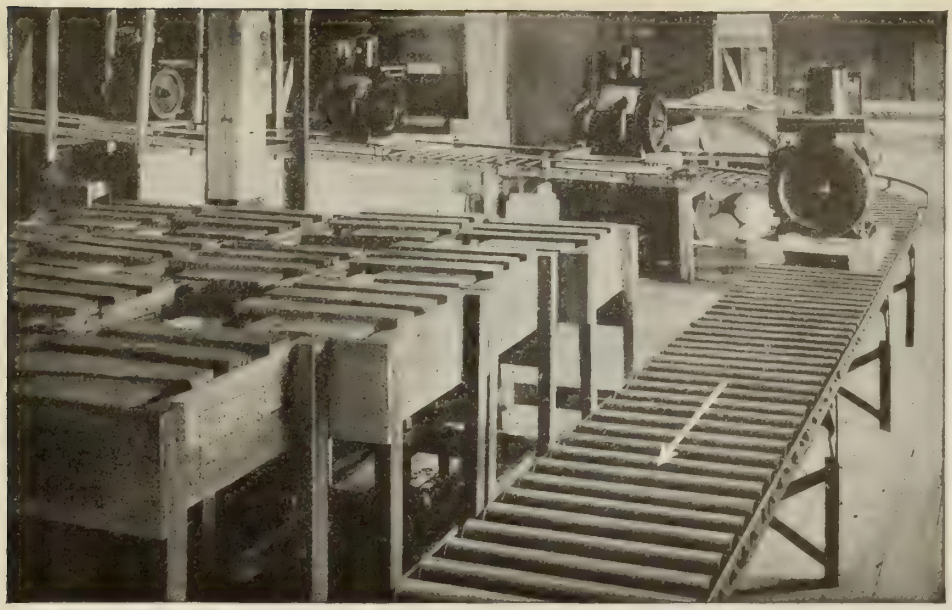

FIG. 3.—THESE DELCO LIGHT OUTFITS ARE CRATED AND STENCILED WHILE ON THE MOVE.

YARDS, FEET AND INCHES

It is interesting to study how standards of measurements are arrived at, or least how they were arrived at in days of old. It is doubtful if anyone would try to get up anything of the kind in these modern days. For instance, the "metre," which is the standard of measurement used in France, is based upon the length of a quadrant of the meridian, measured between the equator and the North Pole. The ten-millionth part of this quadrantal arc was adopted to be the lineal measuring unit. The reader will understand that a meridian is a line, or rather an imaginary line running from the North Pole to the South Pole, and, of course, passing straight through the equator at right angles to it. Correctly speaking, it goes right around, making a complete circle. Now if we take the quadrant or quarter circle of this meridian, which reaches from the equator to the North Pole, and divide it by ten million, we have the "metre" or the French standdard of measurement equivalent to 39.37 inhces, or 1.09362311 yards; the yard being the English standard measure of length, and having equally as interesting a history. The original way of proving the standard English measure was to find the length of a pendulum vibrating seconds of mean time in a vacuum at sea level in the latitude of London. The length of the pendulum which would make this beat in exactly a second, was supposed to be 39.1393 inches, or almost the same as the Frenchman's metre. Why they did not call this the yard is hard to say, but the yard had to be the proper fraction of this to make it 36 inches. Of course, in the first place, there were no inches, but the length of the pendulum divided by 39.1393 made an inch, and this multiplied by 36 made the yard. When the British Parliament Buildings were burned in 1834 the standard Imperial yard went with them, and when an effort was made to replace it by means of the pendulum, it was found to be inaccurate—so much so that finally all attempts at reproducing the lost standard by this means were abandoned. It was then decided to construct a new standard yard by reference to copies that had been previously made, and that had been compared with the original standard yard. The next thing was to get a material which could be relied upon of which to construct the new standard. This work was entrusted to Sir Francis Bailey, who, unfortunately, died before its completion. As the result of a great many experiments, Sir Francis had decided on an alloy composed of 16 parts of copper, 2½ parts tin, and 1 part zinc, as the most suitable material for a standard bar. This alloy is still known by the name of "Bailey's Metal." The work of restoration was finally completed by Rev. R. Sheepshanks, and the new standard imperial yard bar that he produced is now known as "Bronze" No. 1. It is made of Bailey's metal; it is 38 inches long and an inch square.

At a distance of 1 inch from each end of the bar, holes are drilled, in which gold plugs are inserted. The upper surface of the plugs is made to coincide with the axis of the bar, to obviate the influence of flexure. Defining lines are parallel, and at right angle to the axis. They represent the yard at a temperature of 62° Fah. Four copies, known as parliamentary copies, were then made and distributed to the Royal mint, and the Westminster Palace. The original bar is kept within the walls of the House of Parliament, while the copy known as "Bronze No. 6," which is the accessible standard used for comparison, is preserved in the strong room of the old Treasury. Additional copies were eventually made, two of which were delivered in 1856 to the United States Government. These are technically known as "Bronze No. 11" and Laow Moor Tron No. 57."

It is a curious fact that while the bars presented to the United States are the standard which Americans depend upon when great precision is required, no standard of length of the English system of measurement has ever been formally legalized in the United States, but in 1866, ten years after receipt of these bars, Congress passed a law declaring a metric bar in the possession of the Government to be the legal standard, so that the only standard of length recognized by law in the United States is the metric. However, Great Britain and Canada, as well as the United States, have used the old yards, feet and inches so long that it is doubtful if a proposed change would find much support, and while the pendulum system of finding the correct yard was proved to be a joke, it might be possible that if a pedestrian with a stride of a metre undertook to step off ten million paces from the equator that he would be a few kilometres astray by the time he reached the ninetieth degree, commonly known as the North Pole.

FIG. 5.—A FOUNDRY EQUIPPED AS SHOWN IS WELL ON THE WAY TO INCREASED PRODUCTION.

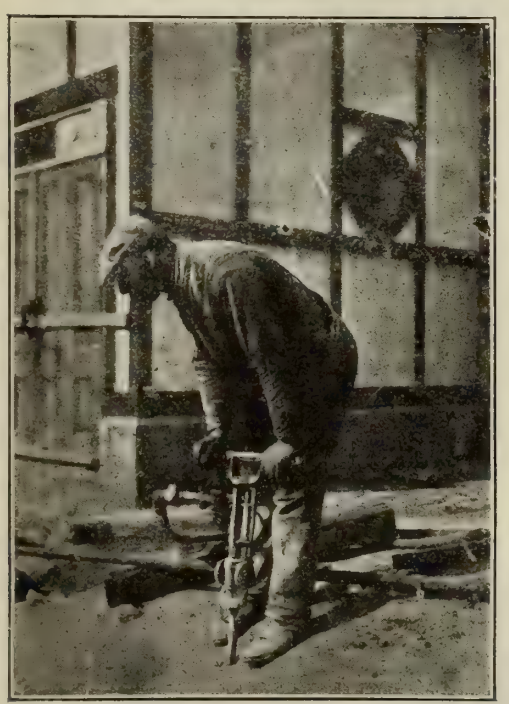
The Use of Compressed Air in Modern Industry

A Comprehensive Study on the Use of Air Operated Tools, in the Mining, Contracting, Foundry, Shipbuilding and Machine Shop Fields. Pumping by Compressed Air is Also Discussed

By A. W. SWAN

IT is a bold undertaking to attempt to give in one article of two or three thousand words a description of the hundred and one uses of compressed air in modern industry, just as it would be to give an adequate description of the part played by electricity in the same space. But electricity has its "press-agents," and the marvels of electrical engineering are far better known outside engineering circles than those of compressed air, although compressed air has almost as many applications.

One is apt to think of compressed air as a rival of electricity; it is quite true that in a few cases one has a choice between the two, but in the great majority of places where compressed air is at



JACKHAMER DRILL ON FOUNDATION WORK, ROMAN CATHOLIC CATHEDRAL, SHERBROOKE.

work, electricity does not offer a satisfactory alternative, and as a matter of fact most modern air compressors have electric drive.

Mining—Rock Drill, Etc.

Perhaps the greatest field of all for compressed air is mining. Since the earliest days of drilling rock by power there has been no serious rival to the pneumatic drill. Electricity is particularly adapted for rotating motion as in the ordinary electric motor; compressed air on the other hand is specially adapted to reciprocating motion as in the pneumatic rock drill, either of the older fashioned type, where the piston was rigidly connected to the drill steel, or the modern "hammer drill," where the piston is free in the cylinder, and literally hammers on the drill steel while the steel is mechanically rotated in the hole. Compressed air can be economically transmitted for long distances with very little loss of power such as occurs from radiation losses, where steam is used, and in mines where sparks of any kind would be highly dangerous—as in coal mining—compressed air is doubly necessary. The modern "hammer-drill" has been very highly developed, drilling 8 to 12 inches a minute in hard rock has become possible, and in fact, the problem now is more to find a drill steel which will withstand the tremendous power of the drill. Two main types of rock drill have been developed, the heavier two-man drill, usually mounted on a tripod or column mounting, and the lighter one-man drill for sinking shafts, etc., and weighing anywhere from 30 to 60 lbs.

Contracting — Rock Drill, Tie-Tamper, Cement-Gun, Etc.

The small rock drill of the jackhamer type is of great service to the contractor. One of the chief troubles in connection with the steam shovel is delay due to large boulders too big for the shovel to handle; in fact W. L. Saunders in his book on "Rock Drilling," estimates delays of thirty to fifty per cent. due to this cause. With a couple of small rock drills on the job, these delays can be largely avoided. Other uses for the small rock drill in contracting work are for breaking rock in foundation and trench work, etc. The photograph illustrates a jackhamer drill at work on the foundation of the new Roman Catholic cathedral at Sherbrooke, Que. This particular contractor has three small rock drills at work all the time on foundation and road work. In structural work the same tool is of considerable value. In reconstructing the Edison Works, Orange, N.J., after the fire in 1914, there were 9,500 window-bolt holes to drill in the concrete walls; this work was all done with the small pneumatic rock drill. For cutting out concrete foundations, drilling holes in concrete floors for machine foundations, etc., the same tool is handy. Still another application is in street railway work for chipping asphalt and concrete. In some cases the jackhamer type of drill is used for this work, at other times the pneumatic tie-tamper. Using the later type of equipment, the Elmira (N.Y.) street railway company found that the average speed was 47 ft. per hour per tool, which is very different from the speed with hand chipping.

The tie-tamper has quite an interesting history; it was at first introduced against some opposition on the part of railway men, but its use has spread so quickly that in five years it has become standard equipment on most of the great railway systems of the United States, and at the convention of the American Railway Engineering Association in Chicago this year one of the speakers declared that "No tool in recent years furnished to the track forces has filled a greater void than the power-operated tie-tamper." The pneumatic tie-tamper operates on the same principle as ordinary hand tamping; the outfits are self-contained, self-propelling, gasoline-driven compressor car with either two or four tamping machines.

PNEUMATIC TIE-TAMPER IN NEW YORK SUBWAY.

Before leaving the subject of contracting we must not forget the use of compressed air in connection with concrete, in the cement-gun and blowing concrete—both patented processes. In using the cement-gun the concrete is blown on as a spray, one of the chief applications of the process is in preserving existing structures such as bridges, etc. Blowing concrete is entirely different. In this process batches of concrete are blown from a central point through pipes to the forms; aggregates up to 4 inches diameter being used; the process is of special value in tunnel work.

Foundry—Air Hoists, Pneumatic Rammer, Sand-Blast, Pneumatic Chipper, Etc.

Coming now to manufacturing, the backbone of supply to most manufacturing plants is the foundry. Compressed air is so valuable in the foundry, and has so many widely varied uses that Mr. Robert L. Streeter has said, "It would not be very far from the truth to say that compressed air is as necessary in the foundry as sand is."

In the first place air hoists have quite a variety of applications. There are two

types of air hoist, each with a definite field of use. The direct-lift hoist consists of cylinder, piston—to which the hoisting rod is directly attached, and valve; and is much the simplest and cheapest form of power hoist, both in first cost and operating expense. The motor type of air hoist has a three-cylinder air motor geared to the hoist proper, the motor being of the same type as is used in the pneumatic drill. The motor type of hoist is not limited in lift as the direct lift air hoist is, and does not require so much headroom; on the other hand, it costs more to instal and operate. Both types find considerable use in foundry work, the direct-lift type for operating core, oven doors, etc., the motor type in operating jib cranes, and on runways to handle moulds, etc.

LITTLE DAVID PNEUMATIC RIVETER AT WORK.

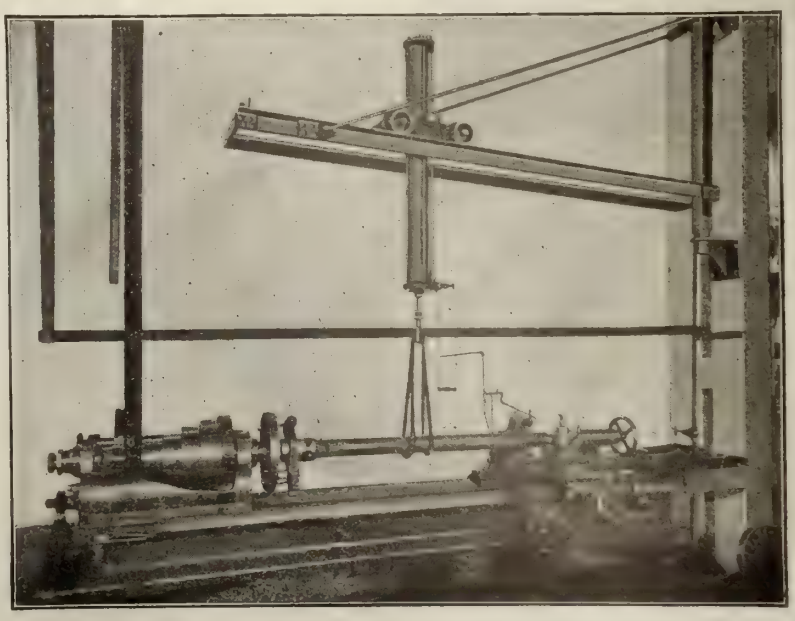
On the foundry moulding floor there are a number of ways in which compressed air is put to work. The core sand is conveniently sifted in an air-operated sand riddle; then there is the pneumatic sand-rammer, which is practically the ordinary hand-rammer operated by compressed air, that is to say the kind of work done by the pneumatic sand-rammer is similar to that done by the hand-rammer, but very much faster, and more uniform. Two types of pneumatic rammer are in use, for bench and floor. W. S. Armstrong, in an article on "Comperssed Air in the Foundry," which appeared in "Compressed Air," quotes a foundry superintendent of his acquaintance as saying: "The pneumatic sand-rammer for foundry work has demonstrated that it is one of the greatest friends and labor savers of the progressive foundryman to-day. When the sand rammer was first introduced there was some criticism concerning it, mainly arising from the natural antipathy mechanics have for anything in the machine line, but as the operators became familiar with its use and recognized its effectiveness, this feeling rapidly disappeared. To-day in our foundry the men take kindly to these rammers, and use them entirely for work of every description."

Power squeezers, roll-over, and pattern-drawing machines—all operated by compressed air—are made by a number of manufacturers such as Tabor, Mumford and others. These cut down the labor and time of making moulds.

Coming to the cleaning department of the foundry the sand-blast claims attention. Of all the various methods of cleaning castings the sand-blast is the best for the greatest variety of work. The sand cleans by a chipping action, and the thousands of sharp particles of clean sand make a good job and absolutely transform the appearance of a machine frame, for instance. Handles and levers that have been sand-blasted are much more pleasant to the feel, and the sand-blast is a valuable help to the inspection department in its search for defects in forgings; these show very plainly after being cleaned in this way. In the early days of development the sand-blast was none too healthy for the operator, but modern equipment with special rooms, etc., has done away with this difficulty to a large extent. A curious point in sand-blasting is that the right pressure to use depends to some extent on the material being cleaned Mr. R. L. Streeter, for instance, gives 60 lbs. pressure for brass and aluminum, 80 lbs. for grey iron and malleable iron, and 90 lbs. for steel castings.

Two of the large family of pneumatic tools are found working in the cleaning department of the foundry: the pneumatic chipper and grinder. Both of these are in use to remove fins, smooth down corners, and generally improve the general appearance of castings. In steel mills pneumatic chippers are also used to chip out seams in order to discover how deep they may be, and determine whether the billet or forging must be scrapped. The pneumatic chipper is an air-operated hammer, the piston moves freely in the cylinder and hammers on the chisel head. The chief point of design is the valve; the number of blows delivered per minute is in the neighborhood of two thousand, and for every stroke the valve must act just at the right time to reverse the flow of compressed air in the tool. Pneumatic chippers are made in various sizes for different classes of work. The pneumatic grinder is operated by a three or four cylinder air motor exactly the same as that used in the pneumatic drill.

A point that should be mentioned in connection with the use of compressed air in the foundry is the advantage of the use of this medium from the point of view of dust. The average foundry is about the most dusty place one could well imagine, and all equipment must be pretty well dust-proof or it will not last very long. Now all air-operated equipment has an exhaust to the air, and if there are any leaks they will be from the machine, not into the machine. Pneumatic tools and air hoists are made



DIRECT LIFT AIR HOIST SWING LATHE.

dust-proof, but even if they were not made dust-proof the air pressure would be sufficient to prevent dust reaching the interior of the machines.

Machine Shop—Air Hoists, Pneumatic Tools, Air Chucks, Etc.

Pneumatic tools find two main applications in machine-shop practice—in the vise department, and in assembly. All vise work includes a considerable amount of chipping, and this can, as a rule, be done better by the pneumatic chipper than by hand. In the assembly department, particularly where machines are at all bulky, there is work for pneumatic chippers, grinders, and drills. The work of the chippers and grinders is similar to their work in the foundry, removing fins, smoothing down corners, and giving that finished appearance that counts unconsciously with the purchaser. The pneumatic drill is handy on account of the fact that it is so readily portable. The main drilling of a shop is done, of course, on the ordinary drill-presses, but as a rule there are some of the holes that can be more conveniently done with the small portable pneumatic drill.

LITTLE DAVID DRILL AT WORK ON WOODEN SHIPBUILDING.

Air hoists have one of their main fields in machine-shop work serving machine-tools. As a rule the direct-lift hoist is best adapted for the medium sized tools, and the motor type for the heavier boring mills, etc., though the Canadian Pacific Railway, for instance, in their Angus Shops, Montreal, use the direct-lift type for some very heavy machine-tools—there is quite a vista of air hoists in these shops. The air hoist serving the machine-tool saves a great deal of time, and one man can run a machine without having to call on a mate for help every time he moves a heavy casting. It would scarcely pay to instal air hoists for machine-tools smaller than a 16 in. swing lathe—we do not advocate compressed air as the universal cure-all—but where the weight of the pieces handled is much over 50 lbs., the air hoist certainly saves money.

The war developed the air-operated chuck and mandrel for lathes. The writer made a number of time-studies on the Jenckes copper-band turning lathe for shells, which had an air-operated clutch with combined control. The average time for six-inch shells, table to table, was 28 seconds for a number of shells; in order to allow plenty of leeway the advertised time was made 40 seconds per shell—and the advertiser was not "drawing the long bow." In the six-inch shell shop of the Canadian Ingersoll-Rand Company, the direct-lift air hoist was used in a rather novel way as a "quick-return" on the boring machines. It was found that a four-inch hoist placed horizontally at the back of the machine, and yoked to the boring carriage was amply powerful enough for the purpose, and relieved the machine operator of a good deal of hard work with very little expense. Still another use for compressed air in this particular shell shop, and one that gained the official approval of the Imperial Munitions Board was the adaptation of the pneumatic drill to driving the screws of the shell boxes. These boxes had ten screws each, to be driven after the shell had been loaded in; the writer's time-studies average thirty-five seconds per box. And, by the way, there is no reason why this particular use for the pneumatic drill should disappear because the war is over.

Shipbuilding

It is no exaggeration to say that compressed air played a very important part in winning the war, the modern shipyard uses compressed air in very large quantities, and the speeding up of shipbuilding that took place in Canada, Great Britain and the United States in the last two years was due largely to the increased use of compressed air. The Hog Island shipyard of the U. S. Emergency Fleet Corporation, for instance, was equipped with the second largest compressed air plant in the world, with a total air capacity exceeding 80,000 cu. ft. per minute.

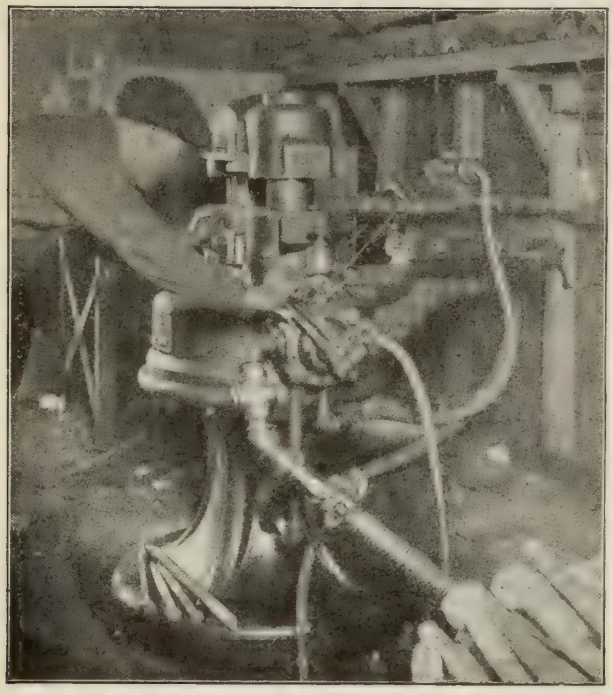
The use of compressed air in shipbuilding brought most into prominence is riveting. A large steel ship requires a million or more rivets to fasten together frames and plates; nowadays these are practically all driven by the pneumatic riveting "gun." For some classes of riveting, in plate shops, for instance, the hydraulic "yoke" riveter is used to advantage, but this machine is bulky, and not readily portable, so that it has little application in shipbuilding practice. There are many requirements for good riveting. "The holes must be in line, the plates must be well bolted together, the rivets must be hot enough to expand and fill the hole the entire length when driven, the holding-on device must hold the rivet firmly in place," etc. The riveting hammer for shipbuilding work weighs about 20 lbs., and contains a steel piston about 1 1-16 in. x 2 1-2 in. or 3 in., with a stroke of 6 inches. For "button-head" rivets a cup-shaped "set" is used which forms the head of the rivet while it is being driven; for "flush" rivets on decks, etc., the "rivet-set" is flat, and the rivet is first battered down, and formed by moving the riveting hammer around the head of the rivet. Although riveting by means of the pneumatic hammer is remarkably speedy, it must not be too fast or the rivet will not have time to shrink properly and fill the hole as it should; which fact makes one a little suspicious about some of the marvellous "records" that used to appear in the newspapers last year.

A. Mason MacFarland in his article on "Pneumatic Riveting Practice," which appeared in CANADIAN MACHINERY for April, 1918, has a pretty good story of the way in which riveting impressed a fair Vassar graduate who was visiting a shipyard. After seeing the rivet driving, she was asked what she thought about it: "It seems so foolish," she said, "to make all those little holes and then fill them up again!"

Among the factors of successful riveting mentioned above, that of correct lining up is important. In very rough riveting practice the holes in the plates are punched in the shop, and may not line up very well when the plates are actually erected. To secure correct alignment the modern practice is to punch the holes smaller than the final size, and ream them to correct size after erection, with pneumatic drills. This is, of course, expensive, but as the gain in strength in the riveted joint is estimated to be over 20 per cent., it is

PNEUMATIC RIVETER CAULKING OAKUM ON SHIP'S DECK, FRASER, FRACE, SHIPYARD.

well worth the cost. Pneumatic chippers are also used for the considerable amount of caulking to be done; for caulking oakum into wooden decks a special pneumatic tool is used. Among Canadian shipyards using this pneumatic caulker for ships' decks may be mentioned Fraser, Brace and Co., of Montreal. The same company has followed the lead of American shipyards in using an air-operated bolt-header adapted from the drill steel sharpener of mining practice. American practice shows that this machine is capable of turning out from 200 to 400 bolt-heads per hour as regular performance, and a variety of small forgings can easily be made on the same machine by using suitable dies.



LEYNER PNEUMATIC BOLT HEADER FORGING HEADS IN

Pumping By Compressed Air

Air lift pumping is not so well known as it should be. While not the most economical form of pumping point of power used, this system has very striking advantages for certain services. In the first place the system is simplicity itself, the whole outfit at the well consisting only of two pipes, an air pipe and a water pipe with a few fittings. The compressed air is supplied from an air compressor which need not be near the well and can conveniently be placed in an existing power house. This simplicity makes the air lift system ideal for isolated plants, villages, etc., for their water supply; for instance, Bishop's College, Lennoxville, Que., is supplied with its drinking water by an air lift taking water from a well 400 ft. deep, and enjoys much more healthy and better tasting water than the village of Lennoxville close by.

In air lift pumping the compressed air does not force the water to the surface as liquids are pumped from tank to tank in displacement pumping. The air is forced to the bottom of the well and mixes with the water forming a foam of bubbles, which is lighter than the water in the surrounding rock and is forced to the surface by the weight of the water surrounding it. To be successful the air must be thoroughly mixed with the water, and all air lift systems have special mixing chambers in which the air is delivered in very small bubbles. Another advantage of air lift pumping is that the water is automatically aerated, which improves it considerably for drinking purposes. In the Bishop's College installation the air compressor is in the main power house two or three hundred yards from the well, and the engineer needs to visit the well only once a week or so to inspect the casing and valves.

Displacement pumping by compressed air is used to a large extent in chemical plants to transfer acids and corrosive liquids; it is also useful for moving liquids containing grit or sand, as there are no moving parts to clog. In the acid plant of the Nichols Chemical Company at Capelton, Que., two compressors run continuously for this service alone; one of the chief advantages of this system of pumping is that in intermittent service a large volume of liquid can be moved very quickly by using the storage capacity of a large air receiver.

An increasingly important application of compressed air in the use of air jet for different purposes. In the first place oil and powdered coal are becoming more and more important as fuel for steam boilers. These cannot be successfully used without a special form of burner, which blows the oil or coal into the furnace, at the same time thoroughly mixing it with air. A large number of burners have been patented for both types of fuel, all, however, include some form of air jet, using either high or low pressure air. The air jet is also very useful in automobile factories for spraying paint and varnish; a number of largest plants paint all their motor cars in this way. In chemical plants, tanneries, etc., textile mills, etc., the air jet offers a simple method of agitating solutions in tanks, and a large amount of compressed air is used for this purpose. For cleaning electric motors, particularly industry surroundings the air jet has no equal; in machine shops the air jet is also handy for different purposes.

Perhaps one of the reasons why the important work of compressed air has been not so well known as it should be is that it has so many applications in so many different trades. For instance, everyone connected with shipbuilding knows all about the pneumatic riveter and drill, but he may not know so much about the importance of compressed air to the mining men, or the uses of compressed air in textile mills, for example. If this short article gives a rough idea of the wideness of the field of application of compressed air it will have accomplished something worth while.

It is only reasonable in concluding an article of this kind, giving the rough outline of what compressed air can do, to refer to the extensive literature on compressed air. Among the larger books there are two of a general nature by Robert Peele and Frank Richards; "Compressed Air for the Metal Worker," by C. A. Hirschberg, of New York, is smaller and more compact. There is also a journal dealing exclusively with compressed air engineering: "Compressed Air," published in New York. All of these are reliable sources of information on different phases of compressed air engineering.

AIR LIFT PUMPING INSTALLATION.

A Discussion on Radiometallography

Being a Few Practical Points From Papers Read at the Joint Meeting of the Faraday and Rontgen Societies. The Possibility of Utilizing X-Ray Examination for Welding is Spoken Of

The joint meeting of the Faraday and Rontgen Societies on April 29, at which there was a general discussion upon radiometallography, created a new interest in the application of X-rays to the examination of hard materials, such as steel and wood. At present, of course, the application of the method to steel is in a preliminary stage, and only thin sections can be radiographed, but there is every indication that before long great progress will be made; indeed, it is not beyond the bounds of possibility that portable apparatus will, ere long, be evolved, by the aid of which material and even structures can be examined in situ. To the inspecting engineer the future in this respect holds out great promise, whilst the saving of time and material will be considerable. We give a few practical points from the papers and discussion, a feature of which was the exhibition of apparatus and radiographs.

Sir Robert Hadfield, F.R.S., president of the society, in his introductory remarks, said it seemed to him that in this method of examination there was a great future for the detection of flaws and imperfections in various ferrous, non-ferrous, and other materials. One of the troubles of the past had been that X-ray examination could only be applied to comparatively thin sections of metal. Some investigators had been able to deal with iron and steel sections up to 4 inches in thickness, and he believed that new apparatus had been completed and was now at work in this country, with which it was hoped to be able to penetrate up to 9 inches thickness. Some time ago he had suggested to Professor W. H. Bragg that it would be most interesting to carry out X-ray examinations of various steels and ferrous alloys in order to ascertain whether their structure showed anything of a special nature. Professor Bragg, having expressed his willingness to do so, a considerable number of specimens had been prepared, as well as specimens of various elements. The latter were as pure as it was possible to get them, although in some cases the purity fell short of the ideal. That was particularly the case with silicon. These specimens of iron, nickel and cobalt had been submitted in the hope that study of their structure might lead to some explanation of the differences of their physical properties. It was well known that, notwithstanding the fact that these metals were in the same group in the periodic table, their physical properties were quite different, whilst the heat changes or critical points showed considerable differences. The critical point in nickel was 350 deg. Cent., in iron 770 deg. Cent., and in cobalt 1,100 deg. Cent. By "critical point" was meant the temperature at which each of the metals changed from magnetic into non-magnetic condition. As regards iron, its change was not quite so sudden. There was a loss of magnetic susceptibility at 730 deg. Cent., which did not completely disappear until about 770 deg. Cent. was reached. A similar range might exist with regard to nickel and cobalt, but these two elements had not yet been so carefully examined. Another curious point was that, so far as was known, cobalt, alloyed with iron, does not give a non-magnetic material. In the case of manganese steel, upon adding manganese in sufficient quantities, say 12 per cent. and upwards, notwithstanding the presence of some 80 per cent. of iron, the material became non-magnetic. In some way, between 24 and 26 per cent. of nickel made iron non-magnetic, but no alloy yet made of iron and cobalt appeared to be non-magnetic, which was rather a curious point, except that, of course, the much higher critical point of cobalt no doubt decided this point.

Professor Bragg then delivered a very interesting lecture on the elementary principles of radiometallography, and indicated the practical possibilities of this method of examination.

Lieut.-Col. C. F. Jenkin said that considerable claims had recently been made for X-rays as detectors of hidden flaws in steel. The only flaws in which he was interested were the hair cracks, which gave considerable trouble in aero engine crank shafts, and although there seemed to be no likelihood that X-rays could reveal them, he was persuaded to test the matter practically. Samples were therefore examined. They were pieces cut from crank shafts with large and relatively obvious flaws, but no trace of defects was shown by the X-rays. One sample, about 2 cm. thick, was cracked right through the thickness for a length of about 6 cm., but there was no evidence of the crack in the radiograph. If such large flaws could not be detected it was obvious that the method was useless for finding hair cracks.

Mr. Eugene Schneider, president of the Iron and Steel Institute, described in a paper the directions in which the method of examination by means of X-rays has been applied at the Creusot works. The general conclusions drawn from the work so far carried out are that in our present state of knowledge of X-rays and their production, the application of radiometallography enabled an examination to be made of ordinary steels, provided their thickness did not exceed 40-45 mm. This limiting thickness was reduced when the steel contained at least one constituent of higher atomic weight. It would be of inestimable value if ingots of 20 cm. could be radiographed, but unfortunately we had not yet reached that stage. Nevertheless, every step in the direction of finding a detector more sensitive to X-rays than those already known would lead to progress in radiometallography. Similarly, as the means of producing X-rays of high penetrative power were improved it would be possible to increase the scope of X-rays in the examination of metals. An interesting application of radiography referred to in this paper was as an aid in sorting out mixed bars of metal, obviating the necessity for a chemical analysis. If, for instance, carbon steel bars had been mixed with tungsten steel bars, they could be sorted out speedily. Bars of unknown composition and a bar of standard steel in these circumstances, could be placed on a slab, a radiograph taken, and the opacity associated with each bar measured. The values obtained could then be compared against a chart drawn up for steels of known composition and permitted of a deduction as to the nature of the various bars. Investigations have been carried out by means of X-rays at the Creusot works: (a) Into segregation and blow-holes and the influence of aluminium upon case steel; (b) The examination of steels containing different percentages of tungsten; and (c) the examination of compound steels.

The application of radiography to the examination of timber, both in the raw and finished state, was dealt with by Major G. W. C Kaye, with special reference to timber for aircraft work. In doing so, Major Kaye drew attention to the low efficiency of the apparatus now in use for dealing with steels. The efficiency of the X-ray tube, for instance, was of the order of one-tenth of 1 per cent. Similarly, the induction coil had a low efficiency, and a tremendous amount of work had yet to be done to improve X-ray apparatus.

In a joint paper by Sir Robert Hadfield and Messrs. S. A. Main and J. Brooksbank, reference was made to the possibility of utilizing X-Ray examination in connection with welding to ascertain the soundness or otherwise of the welds. The expense of the apparatus was admitted to be heavy at present, and its operation suited rather for an expert than for routine purposes. Attention was also called to the fact that at present X-ray examination does not magnify defects; hence its utility is limited to those defects which are of a size within the visibility of the naked eye. Consequently, as many of the defects in steel arise from microscopic causes, we must stil rely for their elucidation on micrography.

Another paper by the same authors described some work in connection with the

*From "Practical Engineer."

radiographic examination of carbon electrodes used for electric furnaces. The investigation was carried out in view of the trouble experienced with these electrodes in practice, and it was thought that radiographic examination might help to show internal causes accounting for their inconsistent behaviour. A number of electrodes from different makers were obtained, but the authors confess that not much light was thrown upon the matter. Whilst the work which was carried out was of great value to Messrs. Hadfield's, it is suggested that the best use of radiographic examination in this connection would be during electrode manufacture where variations of composition, baking temperature, etc., could be experimented upon step by step in the process.

Dr. C. A. Edwards (Manchester University) drew attention to the very great bearing which this work would have upon the future of all metallurgy, not only from the practical side, but also from the theoretical side. It was a great pity from the scientific point of view that the war started just at the moment when Professor Bragg had got out his important work, and he hoped that he would quickly get back to it on metallurgical lines and give metallurgists further important results.

Captain Jackson, Admiralty Inspector of Steel in Sheffield, said he had come to the meeting hoping that he would hear something which would be of practical value in dealing with the inspection of naval ordnance, more particularly in investigating cracks in material. Inspectors of such material desired to pick out flaws and to examine material very rapidly. An enormous amount of material went through their hands, but they had only been able to examine the surface of it in the ordinary way. The application of X-rays, however, would enable them to check whether there were internal flaws in the material without it being necessary to keep any permanent record of the observations, except in cases of defect or suspicion of defect. After listening to Professor Bragg, he almost hoped that they would be able to determine whether there were flaws. by merely passing the material before some form of screen, and by the shadow on the other side to reject or pass it straightaway. There was one very important development which apparently had not yet been reached, and that was the examination of heavy forgings. One of the troubles with heavy gun forgings was the question of small defects in the steel, particularly nickel-chrome steel. With this steel there were typical flaws which did not always appear on the surface. Perhaps it was found that in turning a gun forging certain flaws appeared. With further turning they disappeared, but other flaws made their appearance. When they came to the finished gun forging, perhaps there were no visible flaws, and then the inspectors had to make up their minds whether there were any flaws in the forging or not. As they could not see any they had to say there were none. In order, however, to accept forgings under these conditions, and so as not to run any risk in doing so, it was necessary to have a large margin of safety in the design, whereas if they could be perfectly certain that there were no flaws, that margin could be reduced. A large margin of safety meant unnecessary strength, the article was heavier than need be, and there was waste of material and waste of efficiency. Consequently, if X-Ray examination could be developed so that it was possible to thoroughly examine thick steel forgings to ascertain whether there were any flaws in them or not, it would be of great practical advantage in the development of ordnance. There was another direction in which such a method would be valuable. During the times of pressure through which we had recently been, the assembling and inspection of fuses had to be carried out with great rapidity ,and there was always the possibility of important components being left out. In two particular instances which came under his notice it was wanted to know whether components had been omitted from certain fuses, and X-ray examination would have enabled him to have examined the fuses without the trouble of having them taken to pieces to find out, and then having to reassemble them again. He did not know at the time that X-ray examination was a practical proposition, and the work involved was enormous.—"The Practical Engineer."

The "Engineer" publishes some concise data on the R 34's journey worth repeating. They comment as follows:

"The double journey across the Atlantic to America and back, of the Clyde-built rigid airship R 34, following within a month a non-stop aeroplane flight from Newfoundland to Ireland, represents a triumph for British aeronautics of no mean order. From the utilitarian point of view we may not have gained much from either flight, and from the commercial standpoint we may have demonstrated nothing except that the regular passage of the Atlantic by air is still too costly and uncertain to contemplate seriously. On the other hand, the flights have shown in an incontestable manner the vast progress which aeronautical design and construction have made in this country during the past few years. In both instances everything about the aircraft was entirely of British production, from the engines to the wireless equipment, from the metal of the airship's framework to the linen of the aeroplane's wings. The flight of the R 34 under the command of Major G. H. Scott was begun from the East Fortune Aerodrome at 1.48 a.m. G.M.T. on the 2nd of the month. After a comparatively uneventful journey—nothing worse occurred than the cracking of a cylinder water jacket, which was repaired with a piece of copper sheeting and chewing gum—the airship arrived over Newfoundland at about 2 p.m. on the 4th. Although the petrol carried amounted at the outset to 4,900 gallons—nearly 16 tons—the fuel supply began at that period to give some grounds for anxiety. Nevertheless the journey was continued, and in the end the airship landed at Mineola, Long Island, at 1.54 p.m. G.M.T. on the 6th with a petrol supply sufficient only for 40 minutes' further flight. The total time occupied on the journey of 3,130 sea miles was 108 hours 12 minutes. The number on board was 31. The airship was moored in the open, and as a result of straining at the mooring cable some slight damage was caused to the nose end. Temporary repairs were effected, and at 4.55 a.m. G.M.T. on the 10th the airship, after cruising over New York, left on her homeward journey, carrying 4,600 gallons of fuel. Favored by a following wind, the trip was carried through expeditiously, although one of the five engines was put completely out of action by the breaking of a connecting-rod. Clifden was reached at 8 p.m. on the 12th —61½ hours after crossing the American coast at Long Island, and at 6.57 a.m. on the 13th a landing was made at Pulham Aerodrome, in Norfolk, with 1,000 gallons of petrol still unused. It was originally intended that the vessel should return to its starting place, but the bad weather in Scotland rendered that course inadvisable. The homeward return journey occupied 3 days 3 hours and 3 minutes.

It has long been known that as the result of spontaneous combustion fires often originate in the interior of large coal piles, especially when the coal is fine and contains a large percentage of sulphur. Some of the recent coal-pile fires have demonstrated, however, that under favorable conditions spontaneous combustion is liable to take place even in piles composed of coal in large lumps. It depends principally upon the nature of the coal and upon the amount of rain to which the pile is exposed.

John A. Thomas, of Columbus, O., who made a special study of spontaneous combustion, is the originator of a simple and effective method of extinguishing such coal fires. The application of his method has prevented enormous damage in several instances, where fire had originated in large accumulations of coal.

Mr. Thomas uses a strong solution of bicarbonate of soda, which he throws upon the burning coal-pile by means of a force pump. The carbon dioxide released from the soda puts out the fire. The gas is assisted by the water which, by the heat of the burning coal, is transformed into steam.

By merely modifying wing curvature, aeroplanes of to-day could be made to fly at a speed of 250 miles an hour, according to a British captain who is considered an aeronautical authority. The obstacle that this would present, however, would be a minimum landing speed of about 150 miles an hour. Greater speed in the air is much to be desired, but no pilot is particularly anxious to bring a machine to earth at a rate such as that indicated.

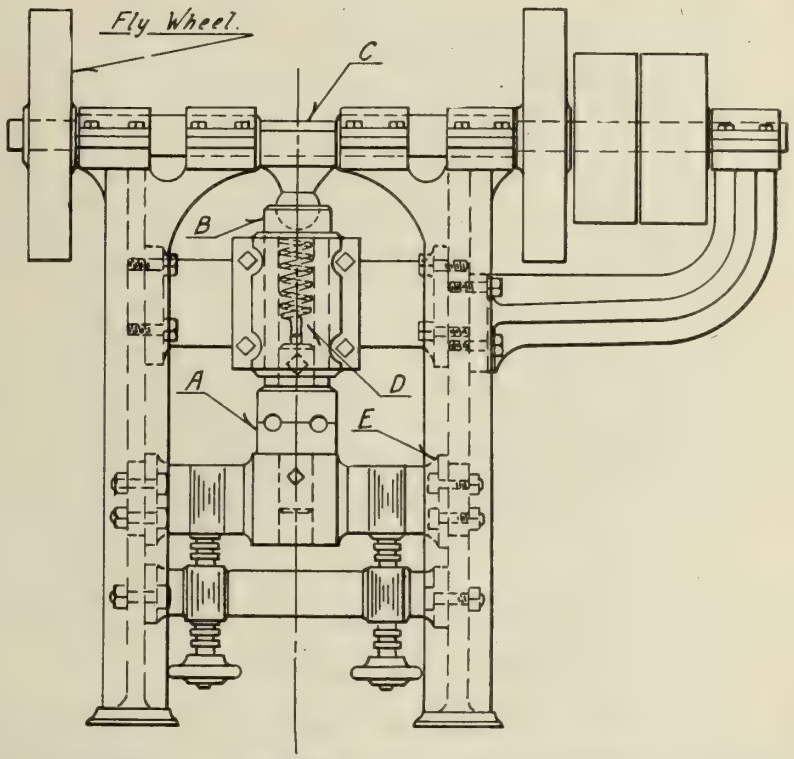
WHAT OUR READERS THINK AND DO

SWAGING MACHINES FOR SMALL SHAFTS

By GEORGE BARRETT

THE accompanying illustration shows a machine designed for swaging buggy and automobile shafts, textile machine spindles, and other work of a similar nature. The anvil block is secured in a cross bar that is bolted to the side supports of the machine. By means of two large square thread screws, the cross bar with the lower swage block is adjustable to the various sizes of dies. The top die is secured in the ram B, which is operated by the eccentric C on the main shaft. On the lower end of the eccentric sheave is a ball that fits into the bearing on the upper end of the ram B. The drive shaft is thrown off centre about ⅜ of an inch, which gives a working stroke to the ram of ¾ of an inch, and a speed of about 1,200 strokes per minute.

There is a key D driven through the central ram bearing, a slot in the ram being made for the vertical movement. The purpose of the key is to provide a thrust for the centre spring, the reaction of the spring being utilized to keep the ram pressed firmly against the ball. The key also serves to maintain alignment of the dies. The machine is belt driven and the shaft is provided with two heavy fly wheels which assure steady action when forging or swaging is in process.



GENERAL VIEW OF THE MACHINE.

FIRST-CLASS FLEXIBLE GRINDER IMPROVIZATION

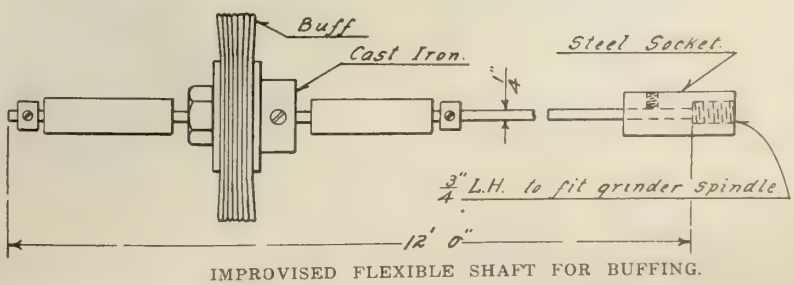
By Donald A. Hampson

We had buffing wheels and rouge, and did more or less polishing of a general nature, in fact we considered ourselves pretty well fixed for this kind of work, but a job came along one day that was beyond us, though it was really very simple with the proper tools. The piece was a built-up device for use in food production—a part about the size of a motor truck radiator, with a nearly-continuous sheet brass shell surrounding, and weighing in the neighborhood of two hundred pounds. This exterior brass surface had to be polished and buffed after the final assembling.

If there had been any kind of a flexible shaft in our equipment it would have been just another everyday job of buffing, but there was not, and we had to get the same results with some sort of a makeshift because the work was not of a size or shape to permit its being presented to a revolving wheel in the usual way.

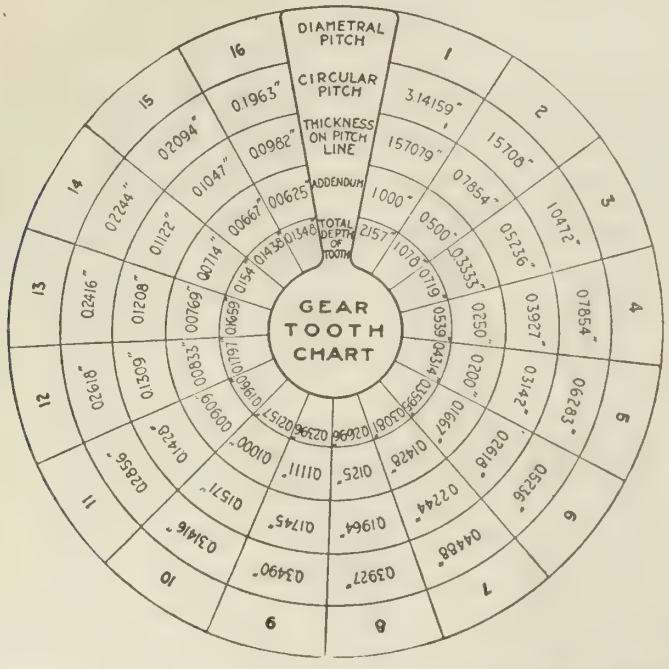
The drawing furnishes details of the "flexible shaft" outfit that was made up—and at no great cost, either. A 12-foot length of ¼ in. cold-drawn steel was set into a socket, or nut, that was threaded to screw on the free end of the Garvin tool and cutter grinder. Five-sixteenth inch holes were drilled through two 6-inch pieces cut from the handle of an old floor broom, these making the workman's handles with which to guide the buffing wheel. A piece of cast iron was turned up and threaded for a standard nut; between this nut and the shoulder of the cast iron piece the buff was held, sufficient grip and stiffness being provided by two flanges of ⅛ in. sheet steel sheared out. As will be seen, this wheel holder receives its drive from the shaft by the safety set-screws, and the roughest kind of collars retain the handles placed either side of the wheel.

In operation, the long length of the small shaft gives the desired flexibility. Use on other work than this one job has proved the rig to be worthy of more than passing notice. The work itself was supported on horses when polishing the broad sides and rested directly on the floor for polishing the edges. While there was some misgiving as to the "whip" of this slender shaft running at a high rate, no trouble was experienced—a one-hand grip would have answered



IMPROVISED FLEXIBLE SHAFT FOR BUFFING.

every purpose, except that of production. As a precaution, a hook was provided for the workman to place the shaft in when not buffing, and a support well weighted was placed midway up the shaft and limiting the shaft to a ring 6 inches diameter at that point. The work turned out was satisfactory in every way and the scheme served the purpose without any delay in getting equipment from a distant point—which we did not know at that time would ever be required again.



GENERAL APPEARANCE OF THE CHART.

A HOME-MADE GEAR CHART

By J. H. Moore

The writer during his drafting experience had considerable gear calculating to do, and naturally got fed up with looking up the tables, formulae, etc., so he devised and made the gear tooth chart shown in the accompanying illustration.

The figures are so arranged that they represent the values of the different diametral pitches.

By moving the centre piece to the pitch desired, all the other necessary dimensions can be read at a glance.

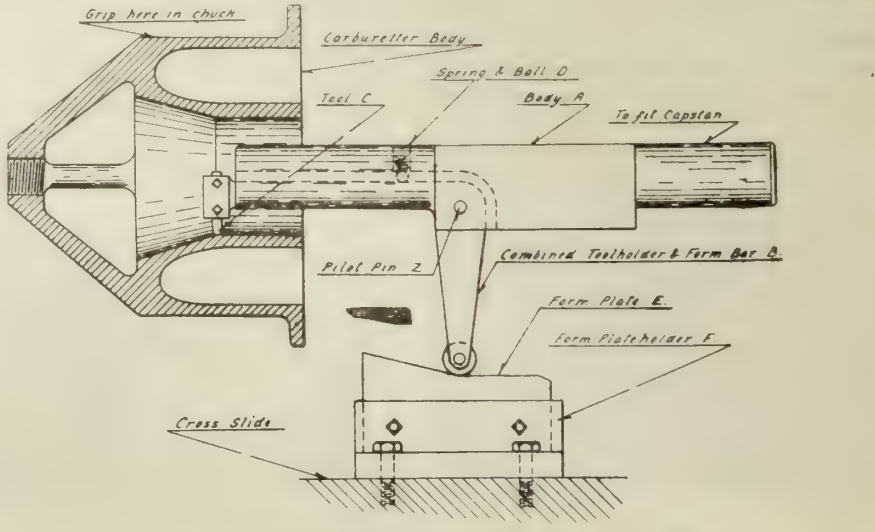
Readers will readily understand the saving of time by the use of such a chart, so as the time necessary to make one of these is a mere nothing, compared with the time saved, they cannot do better than get busy and make one for themselves.

SPECIAL RADIUS-FORMING TOOL FOR CAPSTAN AND TURRET

By G. Blake

The writer, during the war, had to undertake the machining of carburetter parts for aircraft, one of the main parts shown on the sketch, presented difficulties in the way of machining. The taper part at XY had to be machined from the base, gripping the casting (aluminum) in a 3-jaw chuck as per sketch. The following are the particulars of a special tool made to overcome the difficulty. The machine was an 8-in. capstan. The body A is of 2-in. square mild steel turned down on the shank end to fit the capstan head and turned down on the other end to clear the bore in the casting. A ½-in. slot ¾-in. deep was milled along the body to enable the combined tool-holder and form bar B to move up and down, pivoted at Z with a ¼-in. pin, the movement of the tool-holder being limited by the end of the slot milled in the body, with the spring and ball D to keep it rigid. The method of operation is as follows, the tool in the holder being sufficiently short so that it just cleared the parallel part of the bore and commenced cutting on the taper part. The form plate E was fixed in a special bracket on the cross slide. To take a second cut, all that was required was to move the carriage slightly back towards the capstan head, thus making the tool take a deeper cut. A small hardened cast steel roller, fitted in the end of the form bar B, facilitated the movement on the form plate E, which was made of cast steel hardened.

The tool was in every way successful. The cutting tool itself was ¼-in. square high-speed steel.



TAPER FORMING TOOL FOR TURRET LATHE.

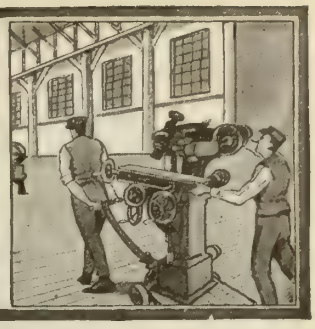
Renewing Operations.—The plant of the Dominion Alcohol Company, at Wotton, Wolfe County, Quebec, will resume operations after a shutdown of six months. The demand for charcoal and wood alcohol, which this firm manufactures, has become very heavy recently.

A fuel-saving measure, which Iceland authorities have found to be very satisfactory, consists in baking bread in a special bakery connected with the local gasworks. The waste heat from the gas plant is used to warm the ovens.

It is a common occurrence for a tap to break when tapping hard metal. If the tap is ground away on the point, so that the first five or six threads will be gradually bevelled, the risk of breakage may be largely avoided. The effect of grinding the end of the tap is to break up the chips into smaller pieces and thus prevent clogging the threads of the tap. This will be found to be especially advantageous in tapping very hard rolled steel.

Here is a little information which will help you to solve the vexing problem that is apt to be a hardy annual, i.e., how much coal to order in order to fill the bunkers, but without having to put some in an old barrel in the outhouse. A ton of egg coal contains from thirty-two to thirty-eight cubic feet, averaging about thirty-five. By measuring the cubical contents of your bin you will be able to estimate how much to order to fill them. This may be done by multiplying together the length, breadth and depth of your bin.

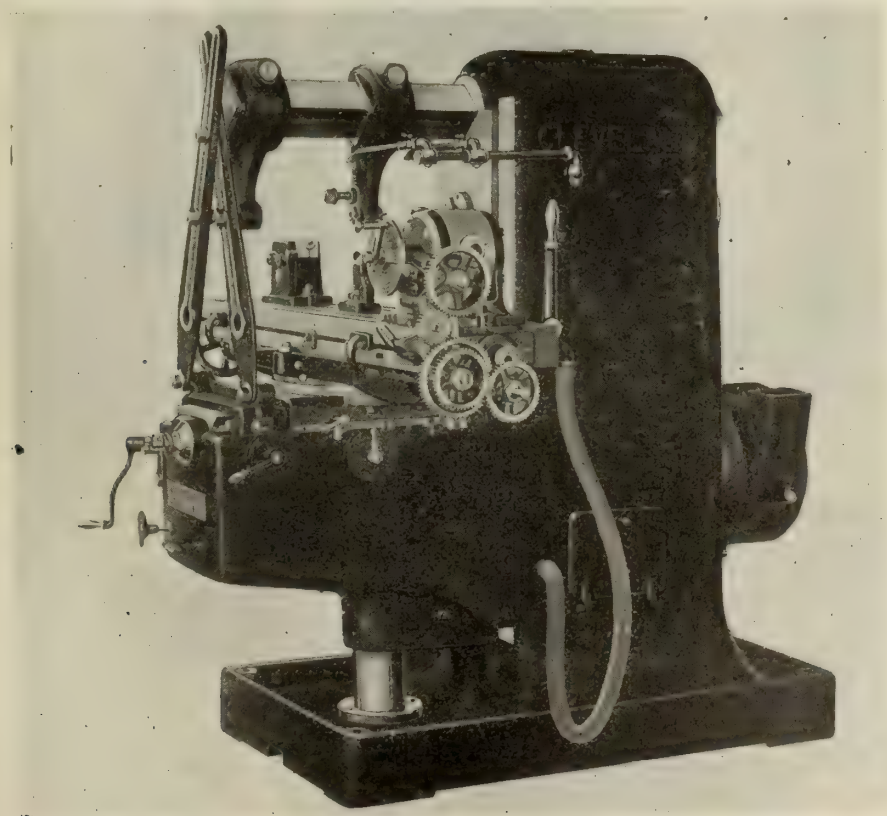
DEVELOPMENTS IN SHOP EQUIPMENT



UNIVERSAL MILLING MACHINE

THE Cleveland No. 1 universal and plain milling machines are of the constant-speed driven type, with 16 changes of feed and of spindle speed. Speeds and feeds are controlled by two levers of the ball-joint type, similar to an automobile gear shift. Changes for both speeds and feeds are obtained through sliding gears which are automatically lubricated. The square overarm and many other improvements are features. The illustration shows clearly the design of the universal type. The column is a complete box section of rigid construction. The base and column are cast in one piece to form a heavy ribbed semi-steel casting, tied together with vertical and horizontal walls. The only openings in the column are those necessary for the change gear levers on the front, the pulley drive housing in the rear, and the cutter lubricant tank on the left side of the machine. Opening of the column is absolutely unnecessary. All the interior parts are lubricated automatically, and all adjustments on the bearings are made from the outside. The dovetail knee slide extends upward to the overarm, thus affording ample surface for clamping the attachments. The depth of the column has been carefully determined in order to place the spindle and the shaft bearings in proper relation to each other to secure maximum rigidity. The dovetail slide on the face of the column is so constructed that the heaviest pressure is not taken at the thinnest section of the column wall as is often the case in milling-machine construction. The horizontal wall separating the lubricating oil reservoir from that of the cutter-cooling compound is designed to give added rigidity to the column. The lower surface of the base is finished to give it a firm foundation, while the contour of the upper surface is pan-shaped with depth enough to catch oil and chips, thus keeping the surroundings clean.

The knee of the machine is strong enough to bear any weight which may be placed on it while doing the heaviest work and has an improved dovetail slide. The bearing of the saddle is not on the thinnest section of the dovetail slide, but on the flat, wide surface, the narrow slide acting as a guide only. There is no bearing in the top of the dovetail guide, which eliminates the possibility of marring due to the operator laying tools on the top of the knee. The bearing of the knee on the column is carried well above the top of the saddle slide, thus giving the knee a longer bearing on the column and reducing the bearing pressure to a minimum. The feed box, as well as the knee, is entirely closed to eliminate the possibility of chips getting into the feed mechanism in the knee. The elevating screw is large in diameter and in one piece. By the use of the post the telescopic screw has been eliminated, the post acting as a support to the elevating nut and as a guide in the knee. The screw is operated with a double bevel gear, hand-feed and power-feed being independent of each other.



UNIVERSAL MILLING MACHINE.

Designers of machine tools find the table and saddle of a milling machine a most trying problem, as these parts are subject to tortional as well as bending moments; therefore these must be designed to resist continuous strains and also maintain their original accuracy. The table of the Cleveland milling machine is machined all over to insure proper alignment, as a table finished on one side only may warp. The bearings on the table are at the top of the saddle instead of at the bottom of the dovetail, a method which secures a large bearing surface and locates the bearings at a greater distance apart. These bearings are automatically lubricated by rollers in the saddle. The bearing on the saddle is also at its widest portion, and both saddle and table bearings are taken up with long taper-gibs which are provided with adjusting screws at both ends.

The square overarm provides positive alignment of the arbors and maximum rigidity of the arm pendants. If the arbor is not exactly true and the arm pendant is brought into place by the operator to accommodate the arbor, the arbor is working in a cramped condition and may break. With the square overarm it is impossible for the operator to place the arbor supports on the overarm and on the arbor in any other way than exactly in line. This simple principle of the square overarm eliminates the possibility of any revolving movement of the pendant and also gives greater bearing surface in column and pendants.

The flanged spindle does away with the overhang on the end of the spindle

as well as the trouble caused by cutters screwing fast on the spindle, and also allows the cutter to be run in either direction. On the flanged spindle is a face keyway, inserted into which are hardened steel jaws for driving arbors and face mills. It is unnecessary to remove these at any time to change from a face mill to an arbor, as the driving is done by the hardened steel jaws. The strain is, therefore, taken off the taper hole. The spindle is provided with a positive lock that enables the operator to loosen the arbor nuts with the least possible difficulty, and is also provided with a handwheel to revolve the spindle, a feature which the operator will find convenient on boring jobs and other milling operations. The spindle lock cannot be operated while the machine is running, nor can the main driving clutch be thrown in while the spindle lock is in this position. The bearings on both the front and rear of the spindle are taken up with a nut on the outside at the back end of the spindle.

All bearings in the column and knee are thoroughly covered with lubricant while the machine is running, thus relieving the operator entirely of the responsibility of oiling the most important parts of the machine and eliminating the necessity of oil holes in any of these parts. This system is highly efficient and is entirely automatic. The reservoir containing the oil has to be filled but twice during the year. As high-speed steel cutters are used almost entirely on milling machines, a reservoir of ample size for cutter-cooling lubricant has been provided. This medium is circulated by a centrifugal pump, which operates only when the spindle does, therefore it is not necessary to shut off the cutter lubricant when changing work or when stopping the machine to measure it. This pump operates automatically when the clutch is thrown in and the machine is running, and supplies a heavy flood of coolant at low pressure to avoid splashing and permit its use in the most ample quantities.

Speeds and Feeds

The speed and feed arrangements are both of the sliding-gear type. All sixteen changes of speeds, as well as feeds, are made by two levers located conveniently for the operator. The spindle speeds are sixteen in number, in either direction, and the feeds are sixteen in number, in either direction also, so that this machine will efficiently handle all classes of cutters. Speeds and feeds being in geometrical ratio, the correct changes of speed and feed for the work to be done can be made without trouble. All gears and shafts in the drive, as well as the feed, are of hardened steel, automatically lubricated, running in bronze bearings and protected against breakage by a safety device.

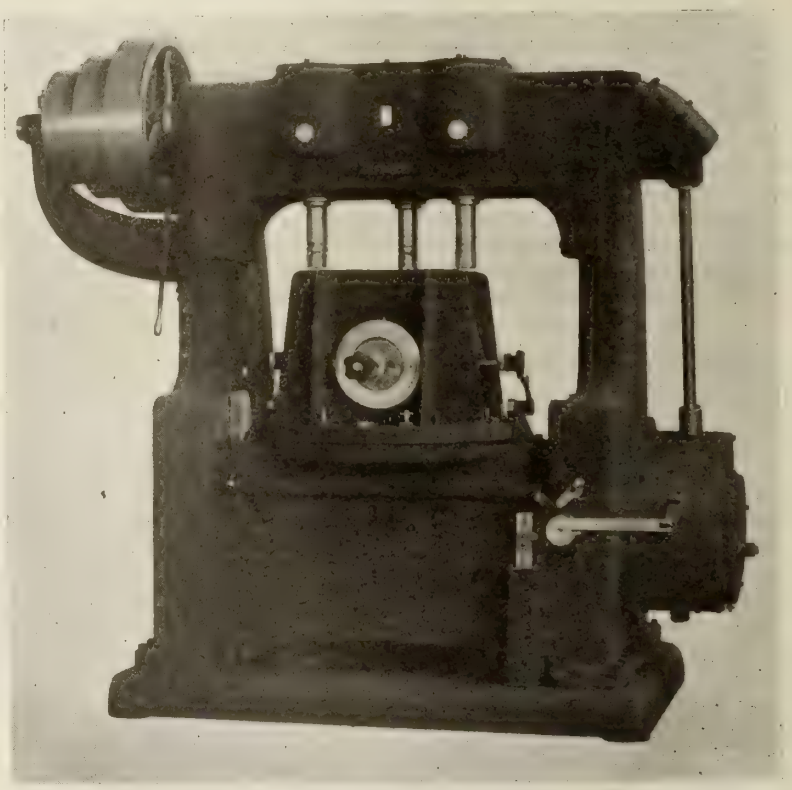
Power is transmitted through a constant-speed drive pulley and the machine is so designed that it requires no loose gears on the spindle. All shifting of gears is done on the secondary shafts below the spindle. The objectionable feature of the tumbler in both the main drive and feed works has been eliminated. The starting and stopping lever can be operated from both sides of the machine and the single pulley running at constant speed for the drive is protected by a belt guard, so constructed that it can be adjusted to any angle and any added extensions. The spindle reverse is contained within the machine so that right or left-hand cutters can be used, and all the speeds, feeds and other driving mechanism are self-contained within the machine. All power gear shafts between the drive shaft and the main spindle are in a vertical line to eliminate all side thrusts in the column casting. These machines are manufactured by the Cleveland Milling Machine Co., Cleveland, Ohio.

CYLINDER BORING MACHINE

THE illustration shows a new vertical gas-engine-cylinder boring machine equipped with a circular indexing jig that is a recent product of the Defiance Machine Works, Defiance, Ohio. The speed and feed mechanisms of this machine are somewhat similar to those incorporated in other machines built by this concern, but the rotating-jig fixture, together with the arrangement of the spindles, is said to be a new method of boring gas-engine cylinders. This method allows the machine to produce constantly and saves the time ordinarily lost in loading and reloading the fixture. The machine is a single-purpose tool and is built in three sizes, taking 36, 48 and 60 in. between the housings. The machine can be fitted with either two or three spindles or with two or three groups of spindles. When fitted with three groups of spindles it will rough-bore, semi-finish and ream gas-engine cylinders of either single units or a number of units cast en bloc, these three operations being accomplished at one time. The circular indexing jig is designed to hold four units, this method of construction allowing the three above-named operations to be carried on at the same time the operator is unloading and loading at the fourth station.

Lubrication is secured by means of a force-feed and splash system, this being made possible by the all-enclosed feature of the machine, both the feed and drive mechanism being tightly encased and practically submerged in a bath of oil, while the bearings are lubricated through individual leads from a force-feed mechanism.

The unit method of construction is followed throughout, each unit being accessible without disturbing other parts of the machine. The drive to the spindle is from a three-step cone pulley through steel worms and bronze worm gears, but instead of driving the spindles by means of keys as in common practice, large tongue drives are cut integral with the spindles and mesh with grooves in the worm gears. This construction is located close to the spindle nose and as used in conjunction with the worm gear is said to effect a very smooth and powerful drive which reduces the possibility of torque in the spindle to a minimum and eliminates the chatter of the cutting tools. The spindles themselves are of hammered stock supported in three bronze bearings. The nose bear-



DEFIANCE GAS ENGINE BORING MACHINE.

ings are of conical shape with a means of adjustment, while end thrust is carried on two sets of SKF ball bearings. Momentum of the spindles can be overcome after the power has been shut off by a friction brake located in the drive pulley and operated by a lever within reach of the operator. The boring tools are fitted to the spindles by tapered shanks and are securely held in place by long bolts passing through the spindles, this method of construction eliminating the possibility of the tools being extracted from the spindle on the return feed.

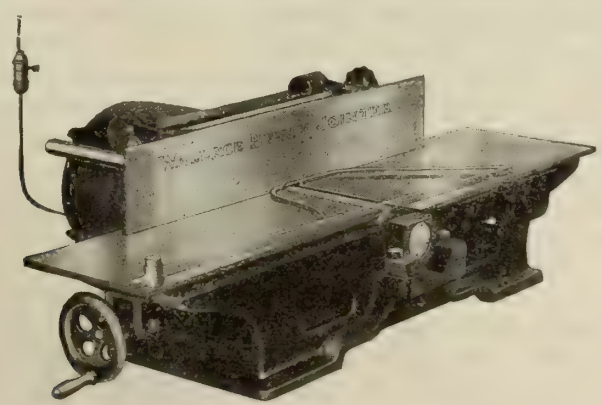
All feed-shaft bearings are bronze bushed, while end thrusts are carried on SKF ball bearings. The feed changes can be made by removing the gear-case cover and changing two gears. A hand adjustment for the table is provided, and when in operation the table feeds the work to the cutters, and when through, the cut automatically reverses on fast travel, returns to the loading position and stops.

The table is raised and lowered by jackscrews, each screw being retained in a jack and actuated by a worm and gear through a bronze nut which is sleeved to the worm gear. Each jack is a unit in itself, and its contents are packed in grease. A means is also provided for adjusting the screws independently to maintain alignment of the table. All thrusts are carried on SKF ball bearings. The jackscrews are located directly beneath the table and a vertical feed is obtained, eliminating side thrust.

The table, column and base are of cast iron, the table being gibbed to the column on both sides. The column and base are of box section, reinforced, and the base rests on the floor at three points only.

WALLACE BENCH JOINTER

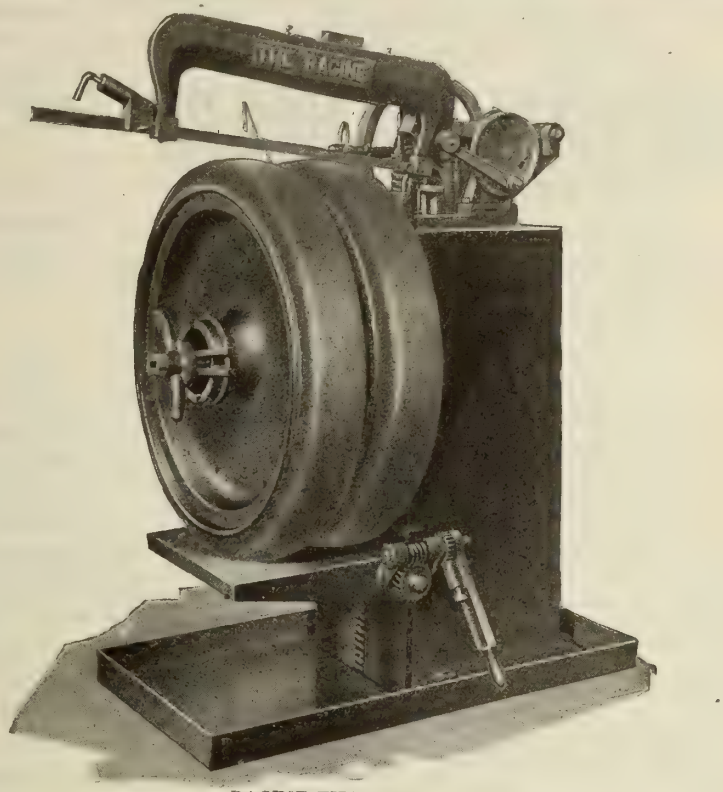
A 6-inch bench jointer which is shown in the accompanying illustration has been developed by J. D. Wallace & Co., 1401-1405 W. Jackson Blvd., Chicago, Ill., for use in working and pattern shops. On account of its smallness and weight, this machine can be readily carried by one man, thus permitting it to be transported to any part of the shop where a machine of this type is required. A feature of the machine is the fence, which is mounted on the motor and slides backward or forward on rods, which allow it to be accurately adjusted. This fence is so designed that only a very small amount of table space is lost when the fence is set for beveling. The motor is connected to the machine in such a manner that the cutter-head can readily be taken out and another head inserted. The tables may be slid away from the cutter-head to permit the use of special heads, or they may be slid forward so as to work with the narrowest possible throat opening. An efficient arrangement of the flap and shutter has been effected by mounting the shutter guard on the cutter-head bearing. The machine is equipped with a motor, lamp cord, and plug for operating from any ordinary lighting circuit.



WALLACE BENCH JOINTER.

RACINE TIRE SAW

The Racine Tool Machine Co., Racine, Wis., has recently developed the hack-saw shown, which is used for removing the steel rims of worn-out truck tires from the wheels. The saw mechanism is mounted on a sturdy base provided with a platform that may be raised or lowered by a ratchet-lever-driven worm, operating a gear in mesh with a rack cut in the base. After the platform is adjusted to the proper height for the wheel being handled, the wheel is locked in place by a bar passing through the shaft hole. The platform may also be provided with a shallow V-shaped top surface to aid in centering and holding the wheel. The saw frame is arranged to hold any size blade up to 24 in. in length by 1 in. in width, and is so arranged that the automatic control mechanism automatically stops the blade when it has finished its cut, parallel to the felloe. The machine can be furnished for either motor or countershaft drive and is provided with a pulley 16 in. in diameter with 4 in. face. It operates at approximately 100 strokes a minute, and will cut a dual tire 17 in. wide from the rim in approximately 10 min. A pump is provided for circulating the cooling liquid during the operation.



RACINE TIRE SAW.

Following are the principal dimensions:

Weight 1,077 lb.; floor space, 24 x 48 in.; distance from top of platform to bottom of blade with platform in lowest position, 44 in.; height of machine from floor to top frame, 5 ft.; blades used, up to 24 in. long and up to 1 in. wide; travel of platform, 14 in.; height of platform above floor when in lowest position, 4 in.; coolant used and circulating pump provided; diameter of drive pulley, 16 in.; face of drive pulley, 4 in.; speed, 100 strokes per minute.

Rub rusty steel with emery paper dipped in turpentine to remove rust. Polish with a fresh piece of emery paper and the result will be satisfactory.

Oil to the Rescue

GREAT stress is being laid these days on the possibilities of oil as fuel to replace coal. The coal situation is becoming acute in every country in the world, and in Great Britain, where coal has for so long been king, it is felt more than in most places. The recent disastrous strikes, coupled with the constant fall of production due to shorter working hours, has caused widespread alarm among all sections of the population, except perhaps among the striking miners. These are evidently of the same frame of mind as the Irishman who, when being lowered down a well, demanded to be pulled up. He backed up his demand with the statement that if it was not complied with he would cut the rope.

The value of oil has been appreciated for a long time now, but one of the reasons it has not been used more generally for fuel aboard ship has been the lack of suitable fuel oil stations in different parts of the world. This is being rapidly overcome, and if the present boring operations in Great Britain result in the discovery of an adequate supply, the situation will be materially relieved. Oil, whether used as fuel for a steam boiler, or directly in the cylinders of an internal combustion engine, is a much more satisfactory fuel than coal. It is more easily and quickly handled than coal, and its heat value is about one-third greater. Combustion is carried out more efficiently than with coal, and there is an entire absence of smoke. The cruising radius of a steamer fitted with oil burners is considerably more than when coal burning, the crew required is less, and the oil can be carried in ballast tanks instead of occupying space that could otherwise be devoted to profitable cargo.

On shore there are a great number of uses for it. Besides being available for steam-raising purposes, it is the best and most economical medium for supplying heat to metal-working furnaces, for tempering, annealing, enamelling, etc. Mixed with the finer refuse of the coal pit, it makes a colloidal fuel of great value. We may look forward to the next few years for great developments in the use of this fuel, which provides a means of obtaining our power at a much higher rate of efficiency than we have been accustomed to getting with the use of coal. It should not be long before it can be applied safely and economically to the heating of houses, to the great relief of the average citizen of this country of long winters.

Don't See the Danger

HERE is a sample of the material that is being published in regard to prices of food. This does not seem to come in the nature of an explanation as to why conditions were forcing up prices. On the other hand it looks very much like a deliberate notice that on a certain date a mild form of highway robbery was going to be perpetrated:

> Edmonton, Aug. 28—In spite of denials by Montreal and Toronto wholesalers of reports that the price of sugar is to be increased, five cars of sugar were to-day offered Edmonton wholesalers on a basis of 17 cents per pound. The previous highest quotations in this wholesale field was 12 cents per pound. Thus this new quotation for fall stocks shows an increase of five cents per pound. This will represent an increase of at least five cents per pound when it reaches the retailer, and an increase of probably seven or eight cents per pound to the retailer, meaning to the consumer not less than twenty-five cents per pound. A local daily devotes a column editorially to the subject to-day, under the caption of "The Sugar Brigands."

The men who are responsible for this condition of affairs are certainly short-sighted, as any simple ostrich that ever stuck its head in the sand in the presence of danger.

They are not reading the signs of the times, nor are they paying attention to the fact that this is coming to be more and more the day of the common people.

It is almost a lamentable thing to see a man or a body of men still obsessed of the fact that they can go ahead and mulct the people without having to stand up later and tell what they have been doing and why.

Only this week a distinguished Canadian, addressing a large body of representative men, was loudly cheered when he stated that any man or firm that took larger profits during the war than in a normal peace-time year, was a profiteer, and worthy of Governmental attention.

You may call it shrewd business; that sounds well. Others not so kindly disposed may refer to it as selfishness, but the man who is being continually gouged by the system is very apt to refer to it as plain theft and robbery. There are laws to deal with the latter class, and it may soon keep some of the profiteers busy explaining why they should be left out of that category.

Politics No Cure Now

THE political parties at Ottawa are doing their best to try and line up again on old lines at Ottawa. They may deny it, but on both sides there are those who seek to bring to bear on the present situation nothing better than the old prejudices and heat of party affiliations.

They have nothing to offer except the return of one or other of the old-time parties to replace the fusion of forces which has taken place.

There are larger problems facing this country now than there were when the war was on. During the war there was a great dynamic force, driving the people together and ahead; there was the imperative element of win or die.

Now these things have been removed, and instead of the war problem of win or die, we have a tremendous economic and financial problem, with its sink or swim alternatives just as clearly marked as day and night.

The Governments of Canada have never yet been able to get right down to hard pan in the matter of administration. For that reason Government jobs have not attracted the best men. It seems to be the idea that it is a life appointment, and this country has always had scores of holders of little jobs that could be swept aside with no loss except to the little holder of the little job.

It is just a question if the people of Canada realize fully the problems with which they are face to face. There is too much political dust. The politician with his eyes glued on the ballot box and the next election is going to pay first and best heed to those things that are going to help get him elected. In the meantime the real big affairs of the country can go to the devil if they please.

If this country had problems during the war, it has more of them now. If they were big then they are infinitely larger to-day.

It looks as though the old political parties were getting ready to grab a war-sickened country by the neck, and shove a dose of old straight-line politics into its poor system.

In which case the country will continue to be sick and its people disgusted.

The Dangerous Car Driver

IT happened at the corner of one of the busy streets in Toronto a few days ago. He was driving his car at a fair rate of speed, and it looked as though he were an amateur at the job. At the corner as he turned to his left he was encountered by a heavy, and fortunately a slow-moving truck. By some strange turn of fortune he hee-hawed around this obstacle. At the curb there was a nice little runabout pulled up. The driver having missed the big truck, could not resist the driverless runabout. Nice driving and a cool head would have carried the day safely but not so with this plunger.

He sideswiped the runabout, caved in the door and running board, jammed the car generally and made his own bus look as though it had been used for trucking purposes on a sixteen-storey building, and by some mishap had fallen out of the window. This being over the car, engine still going strong and clutch in, made a head-on for the curb at the other side of the road. The hydro poles are strong things, and fortunately they are. They took the force of the smash, and by some wonderful process of brain work it occurred to the driver that the next best thing on his part would be to stop the car.

Had there been many people on the road some would have been struck. The driver had no more control of that car than he had of the high cost of living.

Now, the point is here. That driver was probably no worse than scores of others whom the law allows out on the streets in charge of cars. Had he nothing but a straight road, or simple corners, all would be well. But put him in a corner or a hole, and give him something where he has to think and act quickly, he becomes a mighty dangerous element on the road. He is liable to run into anything that is within radius of the engine-power of his car.

The rapidity with which motor traffic is increasing makes it necessary that something should be done to weed out the near-driver of the car. He may be a fine old chap and have no intention whatever of running down any person, or he may be the smart-aleck. The fact is that he can go ahead and take to the road with his chariot, knowing full well that were he to get into a tight place he would explode and drive wild enough for a three-ring circus.

There are rules, regulations and laws for everything under the sun, but there is nothing in sight yet that puts a halter on the fool driver and causes him to sit safely on the kitchen step while a qualified driver looks after the bus and the welfare of its occupants and the travelling public in general.

Speakin' of Profiteers

THE thing that's takin' lots of time and makin' lots of smoke, is the effort that's being made just now to corner certain folk who have been makin' dollars quick and grabbin' of the cash, while others strive to keep alive on sawdust, hay and hash.

They crooked a finger at some prune who ran a butcher shop; he had been gouging folks at home, he made them pay the shot.

He looked the judge right in the eye and waved his fist about, and opened up his sturdy jaw as though to hoot and shout. But then a tear stole to his eye, his voice was soft as lard, his heart was tender as a stew, his countenance not hard.

"Nay, nay," he said, "I am not he who profiteered, by heck, nor soaked the common horde for fair, nor camped upon their neck." Another tear chased down his face and crawled across his jaw, to think that folks suspected him of comin' 'gainst the law.

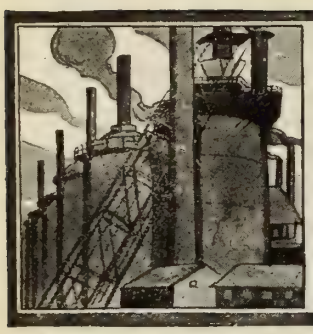
And then they brought a farmer, an honest son of toil, who gouged great holes into the folks, likewise into the soil. Oh, he had bought a joy cart new an' built a new bank barn, and likewise he had carved into the mortgage on his farm. But, bless my soul, he had not made no profits worth the name; his pickin's, so he said, were poor and most uncommon tame.

And so they had a whole procesh to try and find the chap who'd led the profiteerin' biz and staked it on the map. But, good land sakes, he was not there at mornin' nor at night, the chap who'd took the family purse and bled the hang thing white.

I long to see some hardy soul arise and make a bow, and in a voice that's noisy like, far more so than a cow—announce that he's a profiteer, a guzzler and a crab, who'd taken all the things in sight he had a chance to grab!

I would not hiss this chap, oh, no; nor would I heave a brick, nor take my heavy working shoe and aim at him a kick. Nor would I clamor for a chance to smite him on the jaw, nor ask that he be turned unto the 'steenth kind of law.

Far rather would I take my axe, my chisel and my hoe, and then unto some lofty place I'd grab my plans and go, and to this honest, kindly soul who owned up to the graft, I'd raise of granite and of gold a tall and glistening shaft. And on the thing I'd carve a verse, perhaps, in way uncouth, to tell the folks what's yet to come of him who spoke the truth.—ARK.



MARKET DEVELOPMENTS

Labor Trouble Seems To Be More Remote

Independent Mills Seem to Be Quite Emphatic in Claiming That They Will Not Be Tied Up—Dealers Must Have a More Thorough Knowledge of Making of Motor Cars

THE MARKETS AT A GLANCE

UNITED STATES markets should show a tendency to come down to a more settled condition shortly, greatly to the relief of the steel and machine tool industries. As far as the steel situation is concerned, the independents seem to be far more certain than the corporation that their plants will not be tied up. They have assured their agencies in this country that the chances for trouble are becoming more remote each week.

There are some concerns in Canada, especially those building boilers, that have a fine line of business just now. They are buying very heavily, and have orders that run well on into the future. In fact, in referring to one of these concerns a Toronto warehouse stated that, "We have sold more material to them in the last week than in any similar time since we have known them."

There have been no prices changed during the week. There seems to be a desire on the part of many in the trade to leave prices alone as far as possible. The claim is made that further increases simply tend to keep up and increase the agitation that is going on against the cost of materials.

United States points state that the exchange rate is hindering business there, especially anything that looks like export trade, as nations can purchase their needs to much better advantage in other markets where their money is worth more.

The scrap metal market is passing through a peculiar era, for which there seems no good reason, unless it be that there is some manipulation going on in the larger centres. There was a slight break in New York about ten days ago, and so far there has not been a corresponding recovery. Local dealers have not marked down their lists but they state that the figures they are quoting are only nominally correct and may change very suddenly.

MONTREAL REPORTS DEMAND YET FOR THE SECOND-HAND EQUIPMENT

Special to CANADIAN MACHINERY.

MONTREAL, Que., Sept. 4.—While the labor situation in the States appears less acute, there is, nevertheless, an atmosphere of doubt as to what the next few weeks will develop. This uncertainty is reflected in the market here and trading is consequently of a quiet nature. Business continues to drag along as in the last month or so. With little or no change in mill prices dealers continue to quote figures that have prevailed for some time. Early operations and prices will depend, very largely, on the developments of the next few weeks, in which period it is thought that some understanding will be arrived at between the producers and the workmen. Shippers have become interested in the announcement that more cargo space will be available on Atlantic vessels. This has been placed at 50 per cent., an increase of 10 per cent. over what it was expected the Ministry of Shipping would grant to Canadian shippers. The holiday season has had the effect of slowing up business, but sufficient is passing to maintain the interest of manufacturers and dealers. Steel trade has had a quiet week, but indications point to renewed activity early in September. Metals have fallen off a little as a result of the lighter demand. Machinery trading is easier, with second-hand trade becoming lighter. Scraps are moving slowly, but dealers are maintaining firm prices.

Metals Slightly Easier

No material change is reported in the metal situation, and apart from the slight easing of prices, the market is unvaried from that of the past couple of weeks. Demand is, if anything, a little lighter at present, but this condition is generally accepted as being in order at this time of the year. Coppers are down ½ cent, the price quoted being 26½ cents for lake, and 25½ for electro and castings. Tin is steady at 60 cents. Spelter, lead, and antimony are each marked down ¼ cent per lb., the quotations being 9¾ cents for spelter and antimony, and 7¼ cents for lead. Aluminum is quoted at 35 cents, a drop of one cent on the week.

Quiet Week in Machine Tools

There is considerable business being done in second-hand machine tools, but the volume of such sales is gradually assuming a position of less importance. A fair demand is present for new equipment, and this would show some increase if delivery was more certain. Some dealers here have stated that this factor has affected their sales materially. The past week has developed no features of interest and business generally has been below normal.

Scrap Movement Quiet

"The movement in scrap at the present time is of a very conservative character, as we are more or less in the dark as to early developments. The situation in the States, of late, has been a disturbing factor, and the market has consequently been quiet, but little weakness has developed from the lesser demand. Should conditions become more stable there is a possibility that strength will follow. In anticipation of early labor settlements we are holding firm on previous quotations." This statement by a dealer here reflects the general conditions, but coupled with this it should be remembered that August is invariably a quiet period, not only in old materials, but in other lines of industry.

STUDY INDUSTRY TO SELL EFFICIENTLY

Toronto Markets Show Signs of Strength And Business is Reported As Sound

TORONTO.—The holiday has taken, as usual, the keen edge off the business days, according to many of the dealers, who claim that it is almost the middle of the week before they get well under way again. Buying continues to be good in many lines, particularly where the raw materials of manufacture, such as plate, sheets, etc., are concerned.

The scrap metal market is passing through a rather peculiar era, and for no particular or well-defined reason. Those having anything like a large quantity of well-assorted material are simply holding firm and waiting until something more definite develops.

Study the Industry

The methods and ways of doing business are changing, and the machine tool field is no exception to this. The manager of one of the largest Toronto houses sized the situation up as follows this morning: "The Canadian machinery men must study the automobile business if they are going to get the best results from selling to the firms that are in the business and going into it. When a man wants to make cars, his proposition is that he wants and expects the machine tool salesman to get him a plant that he knows will give him the necessary production at the price he is figuring on. Now, in order to do this it is necessary to study and know the business of making cars and their parts. If a certain grinding job cannot be done in the standard equipment, then it may be necessary to specialize and get something that will give quantity production. The same thing can be said of many other operations that are now in many cases considered as being work for standard equipment, but which in reality could be done to better advantage by a special-purpose machine. And right here is where the dealers here often find themselves in trouble. They need a man from the various machine tool works, an engineer, or an expert, who can give expert advice on what his firm can do with these various operations. It is a hard matter for the Canadian dealer always to get this sort of service, but it is a question that must be met."

There are very few dealers in this section of the country that have not been down around the Border Cities during the last few months looking for business. There has been a good lot of selling, especially for the machine tool men with the concerns that are coming over from the United States. One complaint they have is that there is a tendency to do business still "across the line," direct, instead of letting the Canadian representatives of these firms handle their business.

Selling Is Still Brisk

"They bought more this week than in any week since we have known them." That is the way one large warehouse in this city sized up the amount of business that was being taken on by a well-known manufacturing concern. Warehouses in many instances are buying heavily for their own stocks, and find it difficult to keep up with their range. This is especially true with regard to plate, for which there has been a very good demand, and there seems to be no let-up.

Firms that are represented in Canada claim to have no fear of a tie-up of their steel mills. The independents seem to be more certain of this than the corporation mills. They—the independents—state that whatever trouble there has been was local, and adjustment has been made. Of course they realize that it is not well to go the length of making the statement that they will not have a strike, as things all over the world seem to preclude that degree of certainty in referring to any industry or calling.

There is still a desire to take on business in many lines that have been thought to be pretty well sold out and booked up. Concessions are made in queer ways rather than to make a departure from the adopted price schedule. And so it is that the exchange rate provide the latest opening for the concession business. A good many of the mills will now absorb the exchange rate up to three per cent. Some of them held out against this for a while, claiming the prices quoted would be on date of delivery with the exchange paid by the customer on this side of the line. But when one concern or group of them gets away from the beaten path it makes a very good talking point for the buyer who had not heretofore received any concession. Of course many of these little things soon gain circulation in the market, and the demand increases in proportion to the knowledge that concessions are to be had for the insisting. There is also one firm in the copper and brass business that is making this concession on the exchange, but for the most part it applies to plate and sheets, mostly the latter.

Uncertainty in Scrap Metals

There is no saying just at the moment what is likely to happen in the scrap metal market. One does not like to think that there may be a break and indeed there is no reason on the surface why there should be, but for all that there is a feeling of doubt that is putting the scrap metal business on the shelf for the present. The market weakened just about a week or ten days ago, without any warning and for apparently no good cause, apart from manipulation. The starting point of the weakness was in New York, and the situation in those larger centres quickly finds its double in Toronto and Montreal markets. Prices broke there, and there was an immediate tightening up of business. It is not that a half cent off makes such a terrific difference to the market, but it is that this little decline throws a fear into the trading that takes some time to overcome.

Toronto yards are not marking down prices, although they are not keen to do much buying at the values quoted on another page of this week's paper. Unless things show a tendency to come up stronger again the chances are that some of the prices now considered all right will suffer a reduction. For the present, therefore CANADIAN MACHINERY would state that the figures we quote cannot be guaranteed for any length of time. That they are, under the circumstances, nominally correct, is the real situation.

Metals Down a Little

Copper, electro and castings, are a shade off this week. Dealers in copper are not looking for a drop, claiming that if prices do go off it will only be temporary. There is still a very good demand for copper, and that alone is counted upon to keep the prices pretty well up to present levels.

POINTS IN WEEK'S MARKETING NOTES

There is still a considerable amount of uncertainty in the scrap metal markets, and buyers and sellers alike are holding back.

—

Pittsburgh reports that the chances of a strike in the steel trade seem to be growing less. The strike committee will have to call a strike if they wish to convince the steel mills that they are acting for their employees, which claim the steel mills repudiate.

—

In order to make concessions in regard to Canadian business some of the firms are now absorbing the exchange rate up to 3 per cent. At least one copper and brass concern is doing this, while the practice is quite common among the plate and sheet industry.

—

Toronto warehouses are putting some very fine specimens of standard machine tools into stock, the goods having been ordered as far back as three months ago. Deliveries are not improving.

—

Speaking of one well-known Canadian concern, a warehouse representative stated to CANADIAN MACHINERY this week: "They have bought more material in the last week than in any similar time in all the years we have known them."

—

Prices of steel and iron are firm, but there seems to be a growing feeling that there should be no advances announced, as it is in the interests of all concerned that there should be a falling off in the increased cost cry.

EXCHANGE RATES MAKE IT HARD FOR U.S. FIRMS TO DO EXPORT TRADE

Special to CANADIAN MACHINERY.

NEW YORK, Sept. 4.—Labor unrest is having its effect on the machine-tool markets. This has been somewhat marked in the past week, though the outlook is clearer now. The firm attitude of President Wilson on the demands of the railroad shopmen and his insistence that railroad workers on the Pacific Coast return to work have been reflected in a better sentiment. There is not so much fear of a strike in the steel industry now that Samuel Gompers, head of the American Federation of Labor, has had a conference with President Wilson on the subject. Many striking workmen at various plants have returned to work during the past few days, and from every point of view the labor situation looks less disturbing than a week or so ago. The reduction in the cost of living, which the Administration hopes to bring about, will, undoubtedly, have considerable effect in stabilizing industrial conditions.

Despite the lack of any very large buying, a very fair volume of machine-tool business is being done for this season of the year. Some machine-tool builders making machines largely used in the automobile industry are pretty well sold up for several weeks or months ahead. Deliveries on many lines are getting further off. The price situation is also stiffening. Practically nothing is now heard of any price concessions, but quite on the contrary there are more and more predictions that prices will be higher this fall. Some makers of milling machines have made an advance of about 10 per cent., effective at once.

If the exchange situation in European countries would improve, considerable export business would undoubtedly be done by American tool builders, but under present circumstances very little can be accomplished. Japan is the most active foreign buyer, being in a better position than any other large user of American tools to buy here without disadvantage.

There is a fair amount of buying of cranes, but there is keen competition and some slashing of prices on nearly every desirable job. During the war a number of new crane manufacturing companies came into existence, and these are now added to the old plants which were established many years before the war, with the result that there is scarcely enough business for all. It is declared that many crane orders have been taken lately at very close to cost price. The Toledo Bridge & Crane Co., Toledo, Ohio, has received an order from the Pennsylvania Railroad for several cranes for a repair shop at Stark, Ohio, and the Cleveland Crane & Engineering Co., Wickliffe, Ohio, has been awarded an order for about 8 or 10 cranes for the new tube mills of the Youngstown Sheet & Tube Co., Youngstown, Ohio. The Navy Department has awarded to Niles-Bement-Pond Co., New York, an order for five cranes for the Philadelphia Navy Yard.

IT IS NOW UP TO THE STRIKERS TO CARRY OUT THE THREAT TO STRIKE

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., Aug. 30.—Possible labor troubles in the steel industry have been even more the dominant factor in the iron and steel market in the past week. This does not mean by any means that at any time the balance of probability has been that there would be labor troubles. If there were only one chance in 10 or 20 of there being a strike or a voluntary closing of mills (and producers certainly would close their works themselves rather than leave it to the workers to do so) that would be the dominant factor, for the reason that in this dull season there are no other factors or influences of the least importance.

The labor situation, moreover, has had various important ramifications. Its most important is its influence upon prices. Nothing could more thoroughly stabilize prices on their present level than this. On the one hand, with the bare possibility of production being curtailed by labor troubles, no steel manufacturer would think of shading existing prices for the sake of securing an order, for the mills are already fairly well filled with business, and in some lines are crowded, while on the other hand the labor unrest that unquestionably exists, even though it is altogether improbable, there will be any disturbance, is such that any price advancing tendency in the market would be harmful in the extreme. It is the common opinion of nearly all manufacturers, and those who hold the opinion assert it is the opinion of all intelligent manufacturers, that no price advances, even of minor character, are permissible in present circumstances. Price advances would arouse labor to make demands, and would create public antagonism, for the public is now coming to realize that the high cost of living, against which there is so much outcry, is all one thing, made up of many parts, including all wages and prices of all commodities. An advance in any wage rates, or in any commodity, or in any transportation rate, is recognized as affecting the whole structure in which the cost of living is involved.

Thus iron and steel prices may be regarded positively as at a dead level. Recently a few sheet manufacturers started quoting higher prices for their product, but they were very anxious that their names should not get into the trade papers, let alone the daily papers, and now if they do not wish to sell they are much more likely to say simply that they are out of the market than they are to quote a price above the recognized market level.

In some pig iron districts furnaces have been attempting to spread the idea that pig iron prices are higher for next year than the level prevailing for some time past, for this year's deliveries. Assertions have been made that sales have been put through at advances of from 50c to $2 a ton. Generally speaking, such references are undoubtedly incorrect. In occasional instances a buyer of foundry iron may have had occasion to contract for next year in order to cover contracts for the sale of their finished products, but such transactions would be entirely exceptional. Never in the past has the pig iron market advanced that way. When higher prices come, they come first for early delivery, representing in substance a delivery premium, and then if the market is strong enough the higher price gradually extends to the later delivery.

The special committee of the general committee for organizing iron and steel workers, appointed to seek a conference with the iron and steel producers in regard to enforcing the 12 points in the labor platform enunciated July 20, and empowered, in case no conference could be secured, to call a strike, failed to get the conference and thus far has failed to call a strike.

Whether the iron and steel workers have an organization or not is debateable, the manufacturers asserting that the strike vote announced Aug. 20 as 98 per cent. affirmative, did not represent more than 15 per cent. at the outside of the workers. The men soliciting a conference, however, claim they are an organization. In this they have the advantage of the manufacturers, who have no organization, and thus the special committee had to approach Judge Gary, chairman of the Steel Corporation, as the leading man in the trade. When they went to his office Judge Gary sent out word politely declining a personal conference and suggesting that the committee put what it had to say in the form of "a written letter." In writing a letter the committee could not ask Judge Gary, as doubtless it wanted to, to invite all the iron and steel manufacturers to gather for a conference, as Judge Gary would undoubtedly have replied promptly that he was minding his own business and did not care to be the committee's representative in seeking a conference with other manufacturers. The committee, therefore, simply asked for a conference with Judge Gary and Judge Gary replied, refusing, and saying

the Steel Corporation stood for the open shop as against the closed shop and would not discuss business mattters with labor unions. Judge Gary referred to the many things the Steel Corporation had done for its employees, in welfare work of many kinds. The committee replied saying that if these claims as to good treatment were true "even in a minor degree" (and they are absolutely true) the committee would not be seeking a conference. A few days were left and Judge Gary was urged to grant a conference. As he denied that the committee represented the Steel Corporation's employes, they could only prove the point by calling the strike.

The committee then went to Washington, and President Gompers, of the American Federation of Labor, had a conference with President Wilson, who, several days before, had issued a very strong statement, calling for a truce as to all labor demands and during that every citizen co-operate to stop this whole thing. Apparently there was a forlorn hope that the President could be induced to use his influence with the steel manufacturers to get them into conference with the labor leaders, and, obviously, it failed. In bringing the issue before the President the committee burned one of its bridges behind it. It burned another when it wrote to Judge Gary that only a few days were left in which to avert a strike. It burned another, between it and the 12-plank platform enunciated July 20, when it wrote to Judge Gary, "There has not arisen anything between your corporation and your employees, whom we represent, in which the question of 'closed shop' has even been mooted." The fact is that one of those 12 planks was nothing less than a demand for the "check-off," which is the most extreme form of closed shop labor leaders have been able to conceive, and which they never succeeded in establishing, except in some of the union coal mines.

The prevailing view now is that labor demands have just passed their crest and that progress has now commenced towards saner counsels.

MOST FURNACES NOT ANXIOUS TO TAKE ON BUSINESS FOR THE COMING YEAR

The pig iron market still shows strength, with many makers booked up for the present year. 1920 business is not being booked very largely owing to lack of eagerness on the part of furnaces for this business. Basic orders have been placed. Following are reports from U.S. points:

Chicago.—While there is a good general demand, it is not as heavy as in recent weeks. This is chiefly due to labor uncertainty, and makers are not sure how long they can keep their plants running without a strike. The feature of this week's business was the selling of about 30,000 tons basic, in two lots of 10,000 each, and a number of small lots.

Boston.—There have been some sales for 1920 delivery, two orders aggregating 2,000 tons having been sold at $30 furnace for 2.25 to 2.75 silicon. There is no competition from Southern furnaces as far as New England is concerned. About 6,500 tons have been sold during the week.

New York.—There has been a fair volume of business made up of small lots, and generally for this year's delivery. There is but little 1920 business being booked. Export business is very slow, but one lot of 500 tons hematite was booked, and a few tons of foundry iron.

Philadelphia.—Business has been good generally in the pig iron market, bookings being made for both this year and next. 1.75 to 2.25 silicon was sold at $28.50 to $29.50 delivered Philadelphia, 2.25 to 2.75 silicon bringing $1 more for this year delivery, while next year delivery is quoted about $1 higher on all grades.

Buffalo.—There is not much furnace capacity unbooked for this year in this district, and there is not much eagerness on the part of makers to book for next year delivery. Enquiries for about 10,000 tons for first quarter foundry iron are out.

Pittsburgh. — The demand here is chiefly for foundry grade, and one sale of this grade sold for last quarter at 50c per ton over the market rate. Steel making grades are not being called for, but in spite of the limited demand prices in these classes are holding strong.

Cleveland.—Foundries which had completed their purchases for this year are in some cases finding it necessary to come into the market again, their consumption being above expectations. They are after small lots up to 1,000 tons. Furnaces are generally booked up to January 1, and are not looking for 1920 business.

Cincinnati.—Although there is considerable enquiry for next year delivery iron, no quotations have been made on any of these. Higher prices for next year seem to be a foregone conclusion.

St. Louis.—There are numerous enquiries for small tonnages covering both immediate and future shipments, and the market is firm though little actual business has been done.

Birmingham.—Production has increased and several more furnaces are scheduled to blow in during the coming week. At the same time sales have been good and mostly for prompt delivery. An increase of $2 is spoken of for next year delivery.

SOME WEAKNESS IN SCRAP METAL TRADE

With the exception of the New England district, there has been a general weakening of the scrap market. Following are reports from various United States points:

Pittsburgh.—Steel makers are getting more particular about the grade of material delivered to them, with the result that many rejections are being made. Dealers are showing their confidence in future high prices by laying down heavy melting steel at $20.50. No. 1 cupola cast is being bought by dealers at $24.

Boston.—Heavy melting steel has recovered from the decline of last week, and dealers are now being asked $16 for this grade. No. 1 machinery scrap is in good demand, and this grade and stove plate have also stiffened in price. Heavy cast iron scrap was sold at $21.50 delivered.

New York.—The situation in the scrap market is materially better, the trade feeling much less doubt on the score of labor troubles than they have for some time past. Heavy melting is $15.33 to $16 per gross ton New York. Cast scrap and wrought are active.

Philadelphia. — Small business was done in heavy melting during the week. Consumers tried to benefit by the weak market in Pittsburgh by offering $18 to $18.50 delivered for heavy melting steel, but dealers would not sell at this price. Foundry scrap is in good demand.

Buffalo.—Business has been practically at a standstill here, neither dealers nor consumers being willing to do business. All scrap is firm in price, with little selling.

Cleveland.—There have been slight declines in several grades, following a week of stagnation. Heavy melting is down to $20.25 to $20.50. Cast borings $15 to $15.50, and bundled sheets $15.50 to $15.75. Wrought scrap is unchanged.

Chicago.—Dealers are waiting for better prices, and consumers are willing to take the chance of waiting a while, so transactions are practically nil. There is little railroad scrap offering.

Cincinnati.—Business is dull, both dealers and consumers seeming willing to wait. There is not much change in prices, but the situation is weak.

Birmingham.—There are numerous enquiries, but very little activity. There is some inconvenience to the dealers through car shortage, but dealers generally are sitting back and awaiting for an improvement in the market.

OBITUARY

Theodore Cooper, well-known consulting engineer, died at his home in New York at the age of 81 years. Mr. Cooper was identified with the first elevated railroad in New York, and was consulting engineer for the Quebec bridge and the New York Public Library. It was said that had a telegram been received that was sent by Mr. Cooper prior to the collapse of the Quebec bridge in 1907, that accident could have been prevented.

FOREIGN STEEL MAKING LARGE INROADS IN THE BRITISH MARKET

Special to CANADIAN MACHINERY.

SHEFFIELD, ENGLAND.—A most unsatisfactory situation exists at the present time in the iron and steel trades in England because of the recent advance in coal prices and unrest in the coal trade. A sensation was created throughout the country when the Government recently announced an advance of 6s. in the price of coal. This was followed by a serious strike in the South Yorkshire coal field with the result that several steel plants were closed down, while at others output was seriously curtailed. The strike has been settled but unrest still exists.

Owing principally to higher wages, the cost of producing steel has been mounting for some time, and the recent advance in coal has, of course, caused another jump in iron and steel prices. It would almost appear that a climax has been reached, for at present prices the positions of English steel makers is threatened even in the home market, to say nothng of the foreign trade. The situation is interesting to the trade in Canada and the United States for the reason that American mills have been underselling British steel makers in the home market, which incidentally, is causing considerable alarm in England. Some steel men are frankly pessimistic and fear not only competition from the United States in the home markets, but also a serious cut into their export business.

An Acute Position

For some months American material has been coming here, and is causing considerable uneasiness. The unfavorable position of British manufacturers, owing to the fact that America is quoting considerably lower prices is now made more disheartening by the increase in the price of coal. The question of foreign competition will become more acute with the upward tendency in prices as the limit does not appear to have been reached as yet.

There appears to be an opening for Canadian manufacturers in the British mrket under prevailing conditions, for only quite recently a cargo of Canadian steel arrived at Newport, Mon., the price, plus freight, being lower than the home rate. Cheap labor is now a thing of the past in Great Britain, and with it has gone the chief cause for this country's trade supremacy. It remains to be seen if the increase in wages in other countries will affect the situation in England's favor or not.

The export of high-speed tool steels has materially fallen off, and this branch of the steel industry is quiet. There is only a moderate demand for railway steel, but makers of material used in shipbuilding yards and for automobile construction are very busy.

Cutlery are some of the other light steel branches that are very active, and more business is offering on home and foreign accounts than can be accepted. Generally speaking, a large amount of material is required for various purposes, but consumers are holding back with their orders on account of the unsettled conditions prevailing. To use a slang expression, they are waiting to see which way the cat is going to jump. It is generally believed that consumers will be driven more and more into the hands of American manufacturers for supplies, not only for bar iron for rolling and finishing, but for finished products. Even now American bolts and nuts are being imported, a new phase of competition within the last few weeks.

Production Too Low

Little, if any improvement is looked for in the general situation for some considerable time. In the coal trade, as in the iron and steel trade, wages are very much higher than before the war. The rate of production is still far from satisfactory and is generally reported to be anything from 30 to 50 per cent. below the pre-war standard. It is this feature of the situation that is causing so much uneasiness, while in addition, the high prices will retard expansion of trade for both domestic and export account

SECOND-HAND TOOLS BRINGING BIG PRICES IN THE OLD COUNTRY

Special to CANADIAN MACHINERY.

SHEFFIELD, ENGLAND, AUG. 15.—The British Government is selling the equipment at the various National Projectile factories. As might be anticipated some equipment such as shell forging presses, is not in demand, but electric motors and machine tools are selling well, in many cases considerably higher than the original cost.

At a sale recently at a National Projectile factory in Sheffield, 3-phase induction motors sold for £115 and £132 against their cost price of £104 each. A bolt screwing machine, which originally cost £61 15s., realized £100. A number of all geared 16-inch swing, self-acting, sliding, surfacing and screw cutting lathes realized £50 to £60 each. One bolt screwing machine sold for £100 and cost £16 15s. An 18-inch swing all geared head lathe on an 8-foot bed sold for £85; 14-inch stroke double geared self acting slotting machine £305, original cost £245; a 22-inch fixed head drilling machine £60, cost $45 15s.; a planing machine to plane 6-ft. x 3 ft., £380, cost £252; three 9-inch centre double gear screw cutting lathes realized £150, £100 and £50 respectively, and a 7½-inch lathe was bought for £30; a 2 foot 6 inch "Forsdick" radial drilling machine found a buyer at £230, the original cost being £200. A 16-inch stroke swivel head self acting shaping machine was purchased for £145, whilst a number of vertical pneumatic hoists realized from £5 10s. to £8 10s. each.

Prices of new machine tools are holding very firm, but there is little demand. Consumers are now buying much equipment now owing to the unsettled conditions.

AUSTRALIAN TRADE FOR THOSE WHO STUDY FIELD AND GO AFTER BUSINESS

IF the Canadian manufacturers in any and all lines want to secure more of the trade of Australia they will have to make up their minds to look after it more thoroughly than they have ever done before.

That was the opinion of a Canadian business man, who just returned from that country, but who, for various reasons, does not wish to have his name used. "There are developments going on in the steel and iron business there, particularly at the hand of the Broken Hill Company at Newcastle, N.S.W. This company has had a romantic career, and is a wealthy concern. During the war they were careful of their prices. They did not indulge in profiteering, and the chances are that in consequence there may be some favorable tariff arrangements made to assist their future development. In the war period, for instance, you could purchase rails in Australia from that company for less than the freight on them would have been from United States or any other country that was in a position to sell them. Of course, there is a market there for steel. Although the Broken Hill people are making good progress they cannot begin to supply the market. Sheets and bars are the lines most in call just now from what I could observe, although I was not there in the interests of the steel industry.

Must Act Quickly

"There is one thing the Canadian business world should think of," our informant continued, "and that is that there are more mails per day between Hamilton and Toronto than there are between either of these places and Australia. For that reason the people in this country should be very prompt in answering any letters they may happen to receive from Australia. I heard of several cases where this had not been done. In fact, in one instance, I was told of an Australian firm sending letters to several places in Canada and United States asking for certain information about lines in which they were interested. Evidently the United States

MORROW SCREWS MORROW

"CLASS"

There is "Class" to each "MORROW" product; that indefinable something which lifts them out of the ruck.

"Good enough" won't do in "MORROW" manufacture. Everything must be "better than" the average. Each article is built on honor and sold on merit.

As quality is the sole argument to the discerning buyer, we can appeal to him with "MORROW" manufactures.

Remember these "MORROW" products in your next requisition.

"MORROW" Set Screws.
"MORROW" Cap Screws.
"MORROW" Nuts.
"MORROW" Twist Drills.

They have the "CLASS."

John Morrow Screw & Nut Company, Limed

firms had answered immediately upon receipt of the letters, while in the case of the Canadian houses they were away behind, and the business had really been placed before they were heard from.

The Selling Policy

"It is not an easy matter for a new line to be placed on the market in Australia. For instance, I remember seeing one very large machinery house in Melbourne, the name of which I cannot recall for the moment. It had a tremendous floor space and splendid warehouse windows for displaying the goods. I made some enquiries about the manner in which such a business was carried on, thinking that it must take a very large amount of money to stock such a place, but I soon found that much of the material there was consignment goods. Of course, that is not done to such an extent now as before the war. But I was given to understand that at that time business was carried on largely in that way. The firm would order a couple of machines from some well-known English company with whom they had good connections. The two ordered would be sent along, and the English firm at the same time would send along an extra two on the chance of their being disposed of. There are large stocks of machine tools and supplies, such as drills, etc, carried in the same way."

According to the gentleman to whom CANADIAN MACHINERY was speaking, there is a very favorable feeling toward Canadian trade in Australia. He seemed to think that there was also a desire to protect the home-made article wherever it showed a tendency to develop. This representative had been there in the interests of a Canadian firm, and was satisfied with the results of the trip. He seemed sure that the best way to get foreign business was to go after it, study the market thoroughly, find out in what ways the goods wanted differed from those being turned out for home consumption, and then set out to supply them. He instanced the way in which certain of the large agricultural implement firms had set out to supply the Australian trade, and how they had succeeded by making the implements to suit the needs of the various soils and practices of the Australian farmer. The Australian, he concluded, were good buyers now, but they were not buying with their eyes shut.

MONTREAL NOTES

The John McDougall Caledonia Iron Works, of Montreal, are now completely closed pending the further action of the liquidators. The entire plant and property is now for sale.

The grey iron foundry, now under construction for the Thos. Davidson Co. of Montreal, is nearing completion. The walls and roof are about finished and in a few weeks it is anticipated that the equipment will be installed and ready for active operations.

Edward A. Robinson Co., Ltd., of 228 Craig Street W., Montreal, railroad and engineers' supplies, expect to open an office in Toronto in the very near future, with H. H. Davis in charge. L. O. Larkin has been engaged to assist Mr. Robinson in the Montreal office.

The Dominion Bridge Co., of Montreal, have just completed the first of two 2,100 h.p. steam turbo-blowers for the Sudbury plant of the British-American Nickel Co. For the past week this unit has been undergoing tests at the plant of the Bridge Company.

Thos. Moore & Son, 224 Lemoine St., Montreal, have secured the exclusive Canadian agency for McKechnie Bros., Ltd., Metal Works, Rotton Park Street, Birmingham, England, manufacturers of extruded brass rods and sections, hot brass and bronze stampings and pressings, non-ferrous ingot metals, and every description of brass and bronze drop forgings.

Robt. McCleery, formerly works manager of the John McDougall Caledonia Iron Works, is now associated with R. W. D'Arcy in the D'Arcy Engineering Co., efficiency engineers and machinists. They have leased a property at 34 St. Ferdinand Street, Montreal, and are now installing the necessary equipment for immediate operations. The temporary offices are at 95 Laporte Ave., Montreal.

Extensive alterations are being carried out on Commissioners Street, adjoining the Montreal Harbor, in the way of tearing up the pavement and making preparations for the relaying of the tramways tracks, which has been necessitated by the added requirements of the Montreal Harbor Commissioners, who are taking over a considerable strip of Commissioners Street for increased railway accommodation.

Press announcements have just been received that the Ministry of Shipping has reduced their requirements for space on cargo vessels. It was their intention to retain 60 per cent. of the cargo space, but this has been changed to 50 per cent. This will increase the shipping facilities for the Canadian exporters and help greatly in improving conditions, which have apparently been none too favorable during the past few months. It is further announced that there is a good possibility that the control of shipping may be discontinued within the next six or eight months.

REVIEWED YEAR'S BUSINESS AS CARRIED ON AT ALGOMA PLANT

Lower net earnings, but in several respects an improved general position, particularly in regard to the steel industry, are shown in the annual report of the Lake Superior Corporation, issued on Saturday. Net earnings for the year ending June 30 last, from operations of subsidiary companies, excluding the Algoma Central & Hudson Bay Railway, were $5,441,574, compared with $6,551,495 the previous year. The balance brought forward from 1918 was $668,292, but this year the balance carried forward by all companies was $1,589,388. The Algoma Steel Corporation, chief of the subsidiaries, with large works at Sault Ste. Marie, had net operations of $5,035,032, compared with $6,001,891 the previous year. The Steel Corporation, however, in addition to paying a dividend of 7 per cent. on preference stock for the year ended June 30, 1915, amounting to $700,000, paid the sum of $350,000 on account of preference dividend for the year ended June 30, 1916. At the same time, it carried forward a balance of $1,433,875, compared with $764.038 the previous year. Steel Corporation's financial position has been improved, as current assets stand at $13,834,842, compared with $11,147,259 the previous year, while current liabilities are but $2,449,790, compared with $3,059,826 in 1918. Total assets of the Steel Corporation show little change at $55,280,830.

Year's Steel Production

Production by the Algoma Steel Corporation as compared with the preceding year was as follows, in tons:

	1917-1918	1918-1919
Coal imported	995,064	889,591
Ore imported	761,082	700,510
Limestone produced	321,485	296,812
Coke	379,040	406,398
Pig iron	314,188	336,657
Steel ingots	499,712	414,932
Steel products	329,438	322,011

Enlargements to Plant

President Wilfred H. Cunningham, in reviewing conditions, says that the change from war to peace conditions naturally resulted in a stoppage of the manufacture of shell steel and steel for munitions purposes generally. "Toward the end of the year," he says, "the mills resumed the rolling of normal products in the shape of steel rails, rail fastenings, merchant bars, shapes, etc. Up to the time of making this report, business has not been plentiful, and for the last few months the mills have been operating at about half capacity." Mr. Cunningham believes that repairs and replacement orders for steel must soon absorb considerable quantities. The long-cherished idea of a structural mill, he says, should now be dealt with, and plans are in preparation for a new universal mill consisting of a 40-inch blooming mill, 36-inch rougher, and three-stand 28-inch combination structural and rail finishing mills. These works, the directors believe, would have sufficient business, and they are vital to the continued success of the Steel Company. A scheme for financing the undertaking will be submitted to stockholders at an early date. In the meantime, the rail mill is being extended to care for such structural steel up to 15-inch beams and panels as may be required by the market.

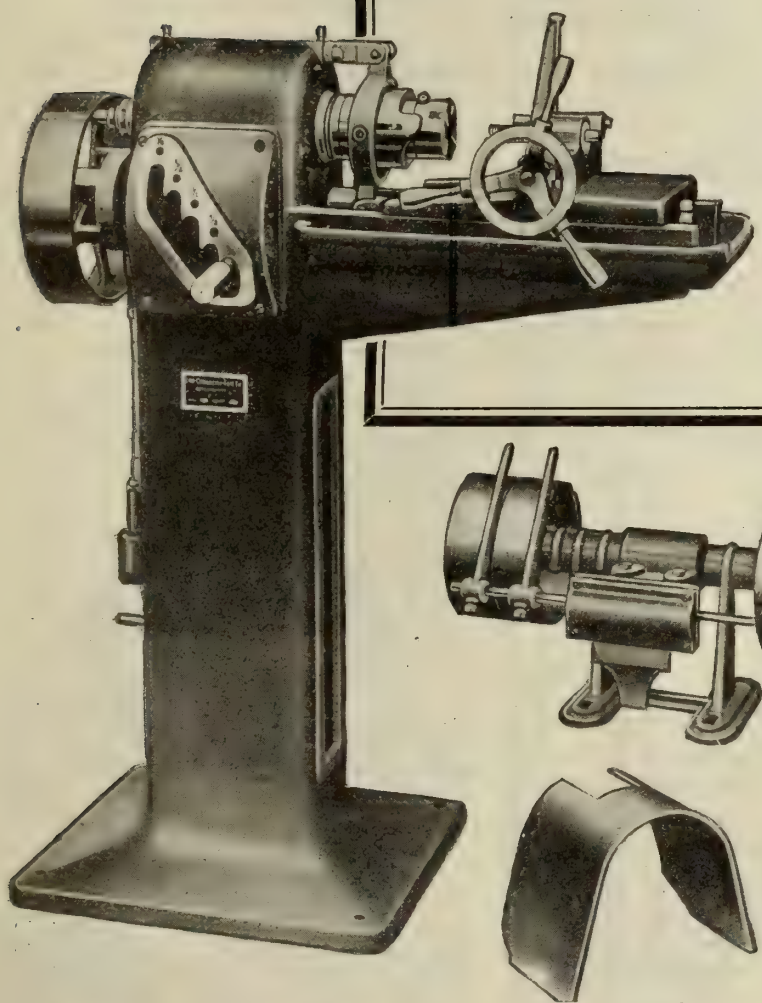
THE GEOMETRIC WAY

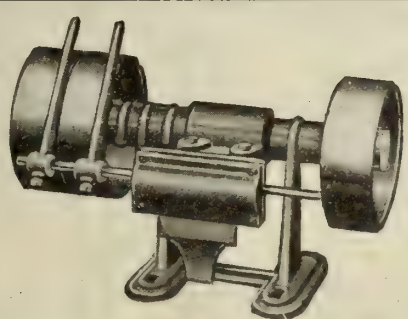
Where quantity and exactness have to be considered, the Geometric Threading Machine is just the way that suits. These machines have been tested and proved over and over again on speed, accuracy and endurance.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut ⅛ to ½ inch, ¼ to ¾ inch, and ¾ to 1½ inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.





A line from you brings full details regarding this machine. Tell us your threading requirements—let us recommend the proper Geometric Collapsing Tap or Self-opening die.

Dumore No. 1 Grinder

Sturdy
Dependable
Accurate

40.00 Complete

THERE is no doubt of the value of the **Dumore No. 1 Grinder.** No other tool, at or anywhere near its price, can give a greater amount of actual, accurate daily service.

Because jigs, dies, gages, bushings, etc., will always warp during tempering, thousands of mechanics use the **Dumore** grinder to bring these tools to as close limits as .0001″. Such a degree of accuracy is possible solely because the **Dumore** is perfectly balanced throughout and operates at the correct cutting speed.

We have some very interesting literature for men facing grinding problems —write for it.

RACINE, WIS.

DUMORE HIGH SPEED GRINDERS

DEVELOPMENT OF THE STEEL PLANTS IN AUSTRALIA IN RECENT YEARS

An issue of the Trade & Commerce Bulletin some months back contained the following reference to the steel business in Australia, which may be interesting at this time:

The president of the Engineering Association of New South Wales reviewed the principal engineering developments at the annual meeting of the association held recently and stated: That quietly, but surely, a powerful steel industry was growing up in Australia. Not only was it expected that the Lithgow (100 miles from Sydney) and Newcastle (60 miles from Sydney) steel works would henceforth provide the whole of Australia's requirements of steel rails, but the time was not far distant when export might be possible. Of yellow and white metal alloys, it was interesting to note the development along sound lines of the manufacture of rolled manganese, phosphor, and other bars, and that difficult business had not been undertaken without due recognition of the necessity for maintaining a laboratory for the scientific control of the processes. Considerable improvement was taking place everywhere in the extension and addition of modern foundry equipment, the capacity of which for large iron castings was now practically unlimited. For the more difficult work of steel casting there was also a most noticeable improvement and an increasing number of plants are being laid down. The casting of steel rolling stock wheels is gradually developing to a satisfactory stage and it was generally understood that the establishment of another modern plant on extensive lines was contemplated in the near future at Newcastle. When it is remembered that there are now approximately 20,000 miles of railway in operation in Australia, it would be realized what possibilities there were for the local manufacture of rolling stock material.

A better example of high class workmanship could not be quoted than the manufacture of modern high speed steam engines which are now being successively made. In the manufacture and export of agricultural machinery, harvesters particularly, quite a striking success has been achieved, and a considerable quantity exported to Argentine and elsewhere. The imperative call of the man on the land for a cheap and handy form of power to supplant hand or horse power has given manufacturers of internal combustion engines a great impetus. Before the war perhaps 10 per cent. of the supply only was made locally and 90 per cent. was imported. In ten years' time the percentage will probably be reversed. Oil engines, from one-half horse power of the farm unit type up to semi-diesel marine engines of 150 horsepower are now being made. Ten years ago only 15 per cent. of the centrifugal pumps used were made locally. This figure is now believed to be 50 per cent. Refrigerating plant has for many years been made, but is worth noting that the largest compression so far made here was recently completed by a local firm. In machine tools, woodworking machinery, rail and road tractors and cars, tinmaking machinery, electric motors, capstans, boilers of every class, including water tube, further reminders are given that engineers are broadening their resources. Steam boilers which before the war could be manufactured and sold for approximately £32 to £40 per ton complete, are now costing £70 to £100 per ton, due almost wholly to the fact that boiler plates are only procurable at from £50 to £80 per ton. If a modern steel plate rolling mill had been established locally it could be producing and selling them under present conditions at £14 per ton.

Mr. G. D. Delprat, general manager of the Broken Hill Co., recently came to America on a special mission, thought to be in connection with purchasing additional plant. The manager of the steel works at Newcastle, N.S.W., is Mr. Baker, formerly manager at Sydney, C.B., of the Dominion Steel Corporation.

Coaling vessels, both with bunker and cargo coal, is carried out in the Far East entirely by hand labor. A series of stages are rigged on the vessel's side from the lighter to the bulwarks. From the bulwarks to the hatch a chain of men, women and children are stationed and on the stages the chain is continued. Many of the women carry their infants strapped on their backs. The coal is passed from hand to hand in tiny baskets, and the coal goes down the hatch in an unbroken stream. With four hatches working, a five thousand ton vessel can be loaded in about twenty working hours.

Navigation through the Suez Canal is carried on at night time by means of powerful search lights. The regular liners carry their own, but the tramps are provided with a portable outfit by the Suex Canal authorities. A cage is slung over the boat containing the light and its operator, who directs the light on to the narrow channel ahead. Current is provided by a small high-speed generator, direct-connected to a Brotherhood high-speed engine, the whole outfit weighing only a few hundred pounds. It is placed on deck and a connection made from one of the forward steam winch pipes to supply the steam. The apparatus can be installed and dismounted in about thirty minutes, so no time is lost.

NEW IRON AND STEEL COMPANY

A charter for $8,000,000 was issued on August 13, to the Consolidated Iron and Steel Corporation Ltd., a company of Detroit and Toronto parties engaged in the mining business. The company is essentially Canadian, with head offices at 20 King Street East, Toronto. They own two large deposits of proven iron ore lands and it is their intention to proceed in a large way with their development.

The company has opened a large hematite mine on the C.N.R. in the county of Leeds, 25 miles north of Brockville at Furnace Falls, where they have 1,500 acres. The early settlers erected a smelter at this place 110 years ago and it was operated in a primitive way, the ore being ground out by water wheel. It still retains the name given to the place at that time. This was in the days when Lake Superior and Pennsylvania ores were almost unknown. The city of Brockville has offered inducements to the company to build a pig iron smelter there, and it is being seriously considered as there is a surplus of electric energy at a low rate. As the mine has excellent transportation facilities, ore can be shipped by the St. Lawrence either west to Canadian and United States markets or east to Montreal, Ottawa and European markets.

Their other property, consisting of 2,500 acres, is located at mileage 182 on the Algoma Central Railway. This has been gradually developed since it was discovered in May, 1911. Up to the present time permanent camps have been built and diamond drilling has been carried on from November 1917, to July, 1918, proving up large deposits of ore to a depth of 500 feet. Prominent iron ore engineers reporting on this property estimate the tonnage at from 800,000,000 to one billion tons of ore. The ore is free from titanium and low in phosphorus and sulphur. Work on both properties is now being carried on, thousands of tons already being piled up at the Furnace Falls mine ready for shipment.

It is anticipated that German railway systems will find great difficulty in rebuilding their lines to pre-war standards, and that cheaper construction will have to be used, both on account of scarcity of raw materials and also financial difficulties.

* * *

Stockroom workers are often required to transform decimals to inches and inches to decimals. In the ordinary stock-room this is done by referring to a book or dirty chart, in most cases practically illegible.

In cases where a room is none too light, which is unfortunately the general condition in stock rooms, an electric light is placed behind the board. The stenciled figures are illuminated and made visible to the stockkeeper wherever in the room he happens to be.

Do You Know That

Antimony is said to have been discovered by Basil Valentine, a monk of Germany, in the fifteenth century. It is said that the word itself is derived from the Arabic.

* * *

The county of Cornwall, Wales, has yielded tin for at least 3,000 years, and the mines of Cornwall have been worked for the oxide of tin since the time of the Phoenicians and Greeks.

* * *

Lead was found before the time of Moses and was known to the Israelites and Hebrews. It was anciently used to purify silver.

* * *

Copper was the first metal known to man. The metal in the form of bricks and rings was used as a medium of trade by the Egyptians and Babylonians. It derived its name from the fact that the Greeks and Romans obtained it from the Island of Cyprus.

* * *

The addition of a small amount of bismuth to babbitt increases the antifrictional properties of the alloy. One-tenth of one per cent. has been added to No. 1 babbitt and the resulting alloy has always been of a fine, close, even grain, with remarkable wearing qualities.

* * *

Much has been written about new and marvellous methods of ship salvage. While apparatus naturally has been improved, the methods remain fundamentally the same. These consist of raising by lighters, in which method the reserve buoyancy of a number of lighters is utilized to raise the wreck from the bottom, the rise of the tide furnishing the lifting power; patching the holes in the hull under water, and pumping out, or building a copper dam on the superstructure to create a reserve buoyancy, and expelling the water by compressed air. For floating grounded vessels it is usually necessary to await a high tide, when there will be a greater depth of water than at the time of stranding.

* * *

An item in an American newspaper speaks about the trouble marine insurance men are having through pilfering of cargoes in Continental ports and mentions Genoa specifically. Genoa has always held an inenviable notoriety through the audacity and cunning of the water-front thieves. On one occasion a steamer undergoing repairs had occasion to send a large bronze valve, about 450 pounds in weight, to the shop on shore. A motor truck with this firm's name on it drove down, three men alighted and took the valve away. That was the last seen of it, and it transpired later that the truck had been taken from the front of the shop while its driver was inside. The truck was later found standing 100 yards from where it was stolen.

A writer in "Aeronautics" has an interesting suggestion to make about the landing of aeroplanes. He points out that this is where the greatest difficulty is experienced owing to the great space required to effect a safe descent. His idea is the building of wind tunnels, in which the aeroplane would meet a current of air driven at the same speed as the machine itself, but in an opposite direction. This would make the movement of the machine over the ground nil, and it could then be secured while the air current and the propellor were both gradually brought to rest.

* * *

The Dominion of Canada, since the beginning of the war, borrowed from the Canadian people no less than $1,436,000,000. This amounts to $192 per capita of population.

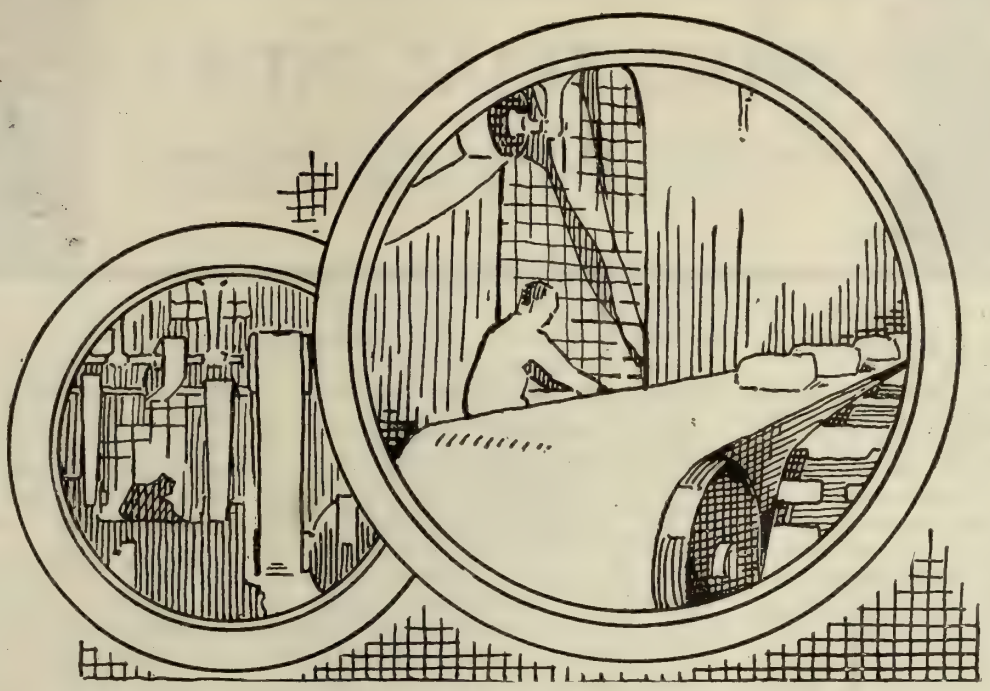
* * *

Tracings may be very readily cleaned and pencil marks removed by the use of benzine, applied with a cotton swab. It may be rubbed freely over the surface without fear of injury to the lines drawn in ink, or even water colors, but pencil marks and dirt will quickly disappear. The benzine evaporates almost immediately, leaving the tracing unharmed. The surface, however, will be somewhat softened, and should be rubbed down with a little powdered talc or chalk before drawing more ink lines.

BOOK REVIEW

Analysis of Babbitt by James Brakes, The Allen Book and Printing Co., Troy, N.Y.

It has been the desire of the author, as stated in his preface, to place before the mining, civil, electrical and mechanical engineer and others who have taken chemical analytical training, a small practical book on the analysis and manufacture of babbitt. The methods have been selected from the many methods in use for their simplicity, neatness and accuracy. At the same time reactions and data have been inserted which will prove interesting to the student in analytical chemistry. One of the most valuable features of the work is an extensive bibliography on books dealing with metallurgical engineering. The various metals met with in the manufacture of babbitt metal and similar alloys are each given a chapter to themselves and their properties, their qualitative, quantitative, volumetric, gravimetric and electrolytic analyses are taken up in detail. Each chapter closes with a bibliography on the metal concerned. Antimony, tin, lead and copper are dealt with. Chapter five takes up the determination of magnesium and bismuth in babbitt, the qualitative analysis of babbitt and gives a bibliography on white metal analysis. Chapter six is devoted to notes on the manufacture of babbitt, examples of calculation, the sampling of babbitt metals and a bibliography of metallurgy. To the works chemist this book of 170 pages will prove an admirable aid where anti-friction metals, etc., are concerned.



How Dominion Rubber System Belting Service Helps Belt Users

For more than fifty years we have specialized in the making of belting and the solving of problems in transmitting power and conveying materials economically.

We maintain a staff of belting experts for the sole purpose of helping Canadian Manufacturers to "speed up" production by cutting belting costs and eliminating power wastage.

These experts will, without charge, analyze your transmission and conveying equipment in its entirety and will recommend changes only where they are necessary to increase the efficiency of that equipment.

You are under no obligation to us in availing yourself of this service — the only return that we request is that you purchase Dominion Rubber System Belting when you have been convinced that the changes recommended by our engineer will be beneficial.

This special service is available through any of our branches.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Victory for Moderation.—The organizer of the International Unions in the West, Mr. R. A. Rigg, has just completed a tour of the West. He states that there is very little sentiment in that district for the principles of the O.B.U. and the unions are practically all lining up with the Internationals.

Estimates Soon Ready.—Sir Adam Beck has assured the citizens of Galt through the mayor, that an estimate of the cost of the proposed Hydro Radial System in this district will be made by the new year. The municipalities will then be able to submit the by-law to the electors.

Building Firms Amalgamate.—The Norcross Brothers Company, of Worcester, Mass, and Anglins, Ltd., of Montreal and Toronto, have amalgamated their interests with the object of creating an organization large enough to handle all the big building that will be carried out in Canada.

Fire Does Small Damage.—The three-storey building of the Gold Medal Furniture Company at Van Horne and Bartlett Avenue, Toronto, was visited by fire which did damage to the extent of $500. The damage was confined to the contents, the building being unhurt.

New Power Company.—A Dominion charter has been obtained for the Wendigo Power Company, which has been capitalized at $1,000,000. The plant of the company will be twenty miles south of Larder Lake, and the head office at Guelph. Water powers on Wendigo Lake and the Blanche River will be developed.

American Army Stores in France.—The property of the American Expeditionary Force now in France, with the exception of the stores required by the American soldiers still in that country, is to be sold to the French Government. The price is said to be $400,000,000, and the method of making payment will be by 10 year gold bonds bearing interest at 5 per cent. from August, 1920.

Ask Delay in Freight Rate Increase.—The Winnipeg Board of Trade, Shippers' Bureau, has sent a wire to the Board of Railway Commissioners, Ottawa, asking for a delay until October 1st or later in the increase granted in express rates. The reason given for the request is that the rates discriminate against the West, and that there are many discrepancies in the schedule.

Strike Breakers Won't Work.—A gang of men brought from Midland to Meaford by the Seaman-Kent Company with the object of breaking the strike of men, refused to work. A scow with 140,000 feet of lumber is waiting to be unloaded, as are a number of Grand Trunk cars. The situation will be aggravated by the lumber in the dry-kilns being exhausted shortly, with no green lumber to take its place.

Largest Airplane Engine.—The Sunbeam Works at Wolverhampton, England, have been recently testing what is said to be the largest airplane engine in the world. The engine is a twelve cylinder one, the cylinders being arranged diagonally. The horsepower expected to be developed is 900 at normal speed, and the weight per horsepower is less than two pounds.

Some Iron Workers Return.—A large Toronto foundry, having offered the moulders 75 cents an hour with an 8-hour day, about twenty men returned to work under these conditions. More will be taken on when production becomes normal. It is understood that a brass-working shop has also made a settlement with its striking employees, but otherwise the situation is as it was.

To Buy Power.—The clerk of the York Township Council has been instructed to write to the Ontario Hydro-Electric Commission, requesting that negotiations be opened to purchase the lines of the Toronto Electric Light within the township. The council is preparing to extend the Hydro through the thickly settled districts, and with only one power company the expense could be lessened considerably.

Wheat Price is Fair.—The general consensus of opinion on the rate fixed by the Wheat Board and approved by the Government is that it is a fair one. The West was under the impression that the rate would be set at $2.25 per bushel, but the award of the Board, $2.15, should be satisfactory. The Government may possibly be a loser at this price, while if a higher price is realized the farmers will receive the benefit of the balance.

Colliery Loses Three Days.—Owing to a dispute over the employment of two men on the bankhead, a colliery of the Sydney Reserve mine has been idle for three days. The disagreement rose over the fact that two men had been employed to push the boxes on and off the scales, and the company thought that one should be sufficient. The men finally resumed work on the understanding that when production was increased sufficiently two men would again be employed.

Making Money From Moss.—The swamp lands in the vicinity of Brockville are to be used as money producers, the medium being the moss that is found in abundance thereon. Three carloads of this moss are being shipped to Rochester, N. Y., for use by nurserymen and florists, who wrap it around the roots of trees that are being shipped, and also in preserving cut flowers. The moss is sold by the cord and brings a good price.

Restrictions Removed.—The British Treasury Department has announced the removal of certain war time restrictions on the export of capital. Hitherto, money could be remitted only for the purpose of paying for merchandise bought abroad. Securities which are held abroad can now be sold on the Stock Exchange provided that they have not been in enemy ownership since the outbreak of the war. Remittances cannot be made abroad for the purchase of any form of property.

Cable Operators Strike.—Something new in the way of strikes has been introduced by the Western operators of the Commercial Cable Company's lines in Canada and the United States. They went out on strike at midnight, the complaint being that they were receiving less money than the company's European operators. They will stay out 48 hours, then return to work for 48 hours, and strike again for 48 hours. This will be continued till their demands are met.

Imperial Trade Opportunities.—The Canadian Trade Commissioner for New Zealand, Mr. William A. Beddoe, has been visiting Sydney, N.S. While there he took occasion to visit the steel plant. In conversation with the officials of the company he stated that there was a good demand for steel products, and this was increasing. The only difficulty in the way was the shortage of ships, and the situation in that respect should improve every month.

Paper Mill For Morristown.—The property owned by the Gillies Brothers at Morristown, directly opposite Brockville, who used the plant as their American

depot, has been sold to representatives of Hearst, the American publisher. It is said that he will erect a mammoth paper mill on the site. Gillies Bros., who are large lumber mill men at Braeside, near Arnprior, formerly conducted a lumber business at Morristown, but closed down when lumber prices rose so high during the war.

The Board of Commerce.—The third member of the newly-formed Board of Commerce has been chosen and appointed in the person of Mr. F. A. Acland, Deputy Minister of Labor. Mr. Acland has been appointed without salary. The appointment, it is understood, is to be temporary, and the Government at a later date, after conference with Judge Robson and Mr. O'Connor, will appoint a permanent member. It is thought that for the first period of the board's activities the experience of Mr. Acland in high cost of living problems, etc., will be of great value.

New Industry for N.B.—The Hardwood Last Block factory, which was spoken of some time ago as about to be located at Mullin's Brook, York County, N.B., is now being built. The site is about four miles from McGiveny Junction on the Canadian National Railway. The interest behind the enterprise is H. Mobbs, of Kettering, England, said to be the largest maker of last blocks in the world. Between one and two hundred persons will be employed to begin with, and the manufacturers have entered into an agreement with the Nashwaak Pulp & Paper Company for 3,000,000 feet of hardwood lumber.

Credit Men Want Probe.—The annual general meeting of Canadian Credit Men's Association, held in Winnipeg under the presidency of Mr. G. N. Jackson, had something to say about increased telegraph rates. They put on record the demand that a thorough and searching investigation should be made by the Railway Board of the telegraph companies' request for higher rates. The alleged discrimination in rates was also mentioned as an object for investigation. The president of the association gave the opinion that in these days of high costs the companies should be pleased if they could make ends meet.

MARINE

London.—The arrival of the Cunard liner "Caronia" in the port of London will be somewhat of an event, the "Caronia" being the largest vessel to enter the port up to date. She is 675 feet long, with a tonnage of 20,000, and will dock in London after landing her Continental passengers in Cherbourg.

Quebec.—The Dussault Company of Levis, which purchased the abandoned wreck of the Canadian Government steamer Montmagny, has floated the vessel after being sunk for four years. The Montmagny was sunk by a collier in thirty feet of water off the Island of Orleans, and three lives were lost.

St. John, N.B.—The War Moncton, a wooden steamer built by Grant & Horne, was launched successfully recently, and is now ready to go on her trial trips, just twelve months after the keel was laid. She is 250 feet long by 43 feet 6 inches beam and 25 feet 6 inches moulded depth, and has a gross tonnage of 2,300 tons. She is a sister ship to the "War Fundy," built at the same yard last year.

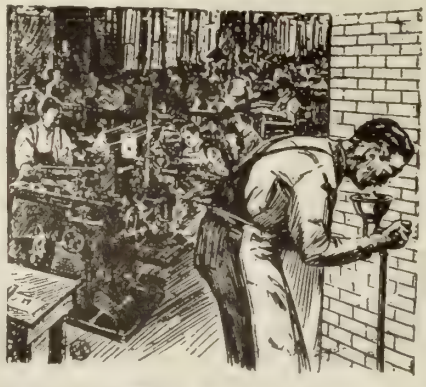
PURO SANITARY DRINKING FOUNTAIN
(MADE IN CANADA)

The only fountain with a bowl that prevents lips touching the bubbler paid its moderate cost over and over in all those well ordered plants whose precautionary measures successfully barred the Spanish influenza. PURO saves lives, time and water. Write

Puro Sanitary Drinking Fountain Co.
147 University Ave., Toronto, Canada



London.—The standard vessels laid down by the British Government have been distributed by Lord Inchcape, chairman of the P. & O. Steamship Company, without any profit to himself or interest to his firm. The amount of tonnage distributed was 1,400,000, contained in 196 ships, and the value of which was $150,000,000.

Sault Ste. Marie.—The steamer Collingwood, drawing 19 ft. 6 in., was compelled to back out of the locks on the Canadian side and go over to the American side before she could get through. The 19 ft. 6 in. was just one inch more than the depth of water that could be put in the locks on the Canadian side. A strong west wind that backed up the water in the river was the cause of this.

Montreal.—There is considerable indignation in Montreal over the action of the Montreal Harbor Commissioners, in increasing wharfage rates without giving the shipping federation or exporters and importers a chance to discuss them. Mr. Robb, the manager of the shipping federation, pointed out that this was an order in council, and how the council could pass such a measure without giving the other side a chance to be heard was more than he could understand.

Brockville.—George C. Sherman, president of the Taggarts Paper Co., and three companions, George W. Mercier, Gus Seymour, and William Lambert, had a narrow escape of drowning when the motor boat they were in blew up. The boat was going along at her usual gait when something happened in the cylinders which caused the whole engine to go up, the boat catching fire as the result of the explosion. The men were rescued with difficulty.

Lauzon. — The Davey Shipbuilding Company of this town have just completed successfully the building of a new bow for the steamer North West. It will be recalled that this vessel was being brought down the lakes in halves last fall, and the bow end was lost in Lake Ontario, together with two men. The stern end was brought on down to Quebec and placed in the Davey dry dock at Lauzon, where the new bow has been made an exact replica of the one that was lost.

Vancouver. — The shipyard of J. Coughlan & Sons, Vancouver, can now boast of its own weekly newspaper. The paper, which contains sixteen sheets, is devoted to live news about the plant and the happenings therein. For the present the paper is known as the J. Coughlan & Sons Plant Publication, but steps are being taken to provide it with a suitable title. One of the means employed to stir the imaginations of the employees is to offer a prize of $10 for the most suitable name. Among the items concerning production is one giving the name of the champion riveter of the yard at the time of publication. For July the best man was E. Peterson.

TENDERS

The Department of Indian Affairs is requesting tenders for the construction of an Indian boarding school at Chapleau, Ont. Tenders will be received up to September 15, and plans and specifications can be obtained from A. D. McNabb, Indian agent, Sault Ste. Marie.

Post Office at Sudbury and North Bay, and J. T. Godfrey, Indian agent, Chapleau.

The Leaside Housing Company are asking for tenders for Leaside houses which will be received up to September 10. Plans and all information can be obtained after September 1 at the office of the Canada Wire and Cable Co., or from William Lyon Somerville, architect, Imperial Bank Building, corner of Yonge and Bloor, Toronto.

BOOK REVIEWS

The Canadian Mining Manual for 1918, edited by Reginald E. Hore. The Times Publishing Co., Toronto and Quebec.

This well-known annual has been enlarged considerably over former years and contains much new material of a statistical and mining nature about Canada's mineral wealth. In this new edition is to be found information concerning all minerals and metals produced in Canada, and all metallurgical and mining companies operating in Canada. Two chief objects have been achieved: to present in concise form matter of interest to persons connected with the industry, and to attract attention to the opportunities for the development of Canada's mineral resources.

The volume is exceptionally well illustrated with colored plates, half-tones and line cuts. A large number of mineral specimens are shown in natural size and color, these plates including some of the best reproductions of ore that have ever been printed. In the section of the book devoted to mine products useful information concerning the character, use and occurrence of each mineral treated. The minerals are dealt with in alphabetical order and the amount of space given to them varies. Owing to the great demand recently for information concerning certain minerals and metals special attention is given to war minerals such as magnesite, fluorite, pyrite, molybdenite, etc. A second large section of the book is devoted to mining and metallurgical companies operating in Canada. In each case is given the office address, the location of the property, and the name of the manager. In most cases capitalization, names of directors, officers, nature of operations, recent financial statement and record of production during the last year are given. These companies are treated of in alphabetical order.

Contents

Mineral production in Canada in 1917; Canada's water powers and their relation to the fuel situation; metals and metallurgical research; annual meeting of the Canadian Mining Institute; Alberta coal mines; the gold industry; the magnesite industry; fluorspar mining in Ontario; oil prospecting in Ontario; tungsten ore deposits in Manitoba; the Mataehewan gold area; Molybdenite mining in Quebec; copper mining and refining in British Columbia; mining in Northern Manitoba; mining companies operating in Canada; mining companies listed according to product.

Oxy-Acetylene Welding and Cutting

This welding repair on broken crank shaft saved an expensive tie-up, at a cost of 50c.

Reduces Repair Costs Saves Time and Money

Oxy-Acetylene Welding is saving hundreds of thousands of dollars annually in Canadian Factories, Mills, Mines, Machine Shops and wherever metal or machinery is used. Broken machinery parts, tools and defective castings are quickly and permanently repaired. Many economies and advantages are derived from welding in construction as well as repairing.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

The Canadian Who Bullied the Bolsheviks!

WHEN war broke out, Colonel "Klondyke" Boyle took across, at his own expense, 200 staunch Yukon volunteers. He was sent to Southern Russia, and in six weeks turned the transport system there from chaos into efficiency. He fed the starving Russian and Roumanian armies. He arranged temporary peace terms between Bolsheviks and Roumanians. Aided by twenty Chinese murderers and a brave Canadian girl, he bluffed the Bolsheviks and Austrians, in a tremendous exploit which won for him the title "Saviour of Roumania," and the personal thanks of the Roumanian royal family.

Read this story of "Klondyke" Boyle, by Arthur Beverley Baxter, in September MACLEAN'S—it starts on page 13.

"Growing Under Gouin"

—tells the amazing story of development of Quebec Province during the past fourteen years —in road-building, finances, industries and education.

"Meet Mr. Habitant"

—What does the rest of Canada know about the Habitant of to-day? Does he talk like Drummond's poems? This article, by Thomas M. Fraser, forcibly depicts the assets Canada has in French-Canadian stability and thrift, and will go far to remove any lingering prejudices which may exist in some minds.

Other Big Features

The Crowning of the King—By J. K. Munro, the pungent, pithy, political pundit.

Nuorteva's Propaganda—By C. H. Cahan, K.C., recently Director of Public Safety.

The White Eagle at Niagara—By Major C. R. Young, late adjutant Polish Army Camp.

The Problem of Our New Canadians—By Nellie McClung.

His Majesty's Well-Beloved—By Baroness Orczy.

Canada's Great National Asset—By D. B. Hanna, president Canadian National Railways.

Teddy Bear—A wonderful, poignant, Robert W. Service poem.

On Leave—A light, frolicsome story by Harry Bailey.

Evil Spirits—Another Bulldog Carney story, by W. A. Fraser.

Ebb and Flow—A new story by C. W. Stephens, who wrote "Man and Wife."

Modern "Magic" Chucks

—Often make unnecessary the purchase of expensive multiples.

Take a look at the picture above. All the tools shown may be used in a magic chuck on drill press or other revolving spindle machine.

The Magic Chuck virtually transforms a single revolving spindle machine into a multiple with as many spindles as you have tools to use. Especially valuable for successive operations which may be performed without resetting the work. For drilling and tapping successive holes of various sizes on one job the Magic Chuck is even a more advantageous tool than a multiple.

The cost is so small that no shop should be without several. You can well afford to equip every revolving spindle machine.

Other Modern Tools

—Modern Plain Grinders
—Modern Universal Grinders
—Modern Internal Grinders
—Modern Chaser Grinders
—Modern Self-Opening Die Heads
—Modern Collapsible Taps
—Modern Tapping Attachments

Reclaiming Broken Tang Drills

One of the collets in the Magic Chuck equipments is for making useful broken drills without necessity of milling keyway or flat spots.

The saving in this use alone will repay the entire initial cost many times.

Send for complete technical bulletin.

RICKERT-SHAFER TAPPERS

Save Tap Breakage

The *smooth drive* reduces the strain on the taps—they wear longer—and there are fewer delays from taps breaking in the work.

R-S Tappers ensure faster tapping and quicker assembling.

Friction drive, absorbing all the shock, allows a chuck speed of 140 r.p.m. on ⅝-in. work—50 per cent. faster than the usual tapping speed for that size. Uses but 1 h.p.

Kelly PRODUCTION Tools

KELLY tools are shown below in operation upon a 24-in. GISHOLT LATHE. The steam engine valve chests, being machined, are of cast-iron and are rough bored and semi-finished with two reamers in one bar. They are then REAMED with finishing reamers in the other bar. These reamers, being properly piloted, pass over THREE PORTS and give a TRUE, SMOOTH hole to close limits.

The hole is approximately 5½-in. diameter. By inserting a different sized set of reamers IN THE SAME BARS, a much larger sized job of a similar nature is performed.

3-B Universal Turret Lathe

HOW ARE YOU EQUIPPED FOR MACHINING CASTINGS AND FORGINGS?

Are you allowing your machining cost to increase with the steadily mounting cost of labor?

Or are you taking advantage of the labor-saving cost reducing possibilities, to be found in the latest developments in machine tools, to keep your manufacturing cost down to the old level?

The Foster Universal Turret Lathes are built for rapid production. They are rigid and powerful. Your heavy forgings and castings can be machined with speed and accuracy on these machines. The cross slide can be facing while the hexagon turret is boring and turning. As many as five to six cutters are often seen working simultaneously.

The control levers for the various units of the machine are centralized. The ease and convenience of manipulation saves the operator time and energy and increases his day's production—and your earnings.

Our production engineers will gladly submit a production estimate covering your work. Send us your blue prints.

Is our catalogue in your file?
If not, write for it to-day.

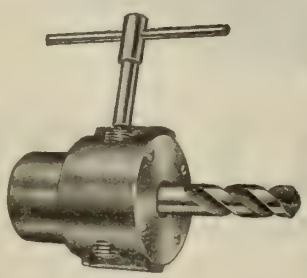
PORTABLE WELDING APPARTUS of all kinds with skilled operators always available to repair your breakdown at once.

THERMIT WELDING on all classes of work is a special feature of present activities.

Manufacturers of Steel Tanks, Air Receivers, Welded Tanks, etc.; Electric Welders, Oxy-Acetylene Welders, Boiler Repairs, Lead Burning and Thermit Welding.



UNION

POSITIVE DRIVE DRILL CHUCKS

The Union Drill Chuck is made in seven sizes (0 to 2 inches) with PATENT TRANSVERSE SLOT—so that drills with tenons can be inserted (see illustration). The shank of drill should be squared on two sides to enter the TRANSVERSE SLOT, giving a positive rotation to the drill independently of the jaws, permitting the jaws to centre and align the drill accurately. The drill is held absolutely true and will not slip under the hardest strain. This type of chuck will be found to give the best results on all classes of work from HIGH SPEED drilling to the hard BLACKSMITH and GENERAL REPAIR work.

BECKER BELT DRIVEN MILLERS

THE MACHINE THAT GIVES THE SMOOTH FINISH

Massively constructed to handle work requiring a powerful machine tool, the Model D-1 fills a distinct want in every large plant.

The control is centralized so that te machine can be advantageously operated by one man, yet none of the Becker features have been sacrificed in its design, in fact, these features have been improved along the lines of greatest efficiency.

Note the large range—the rigid design of the knee supported by two perfectly co-ordinated elevating screws—the wide table, and powerful drive. These are some of the salient points of the Model D-1—Write for further information—To-day—NOW.

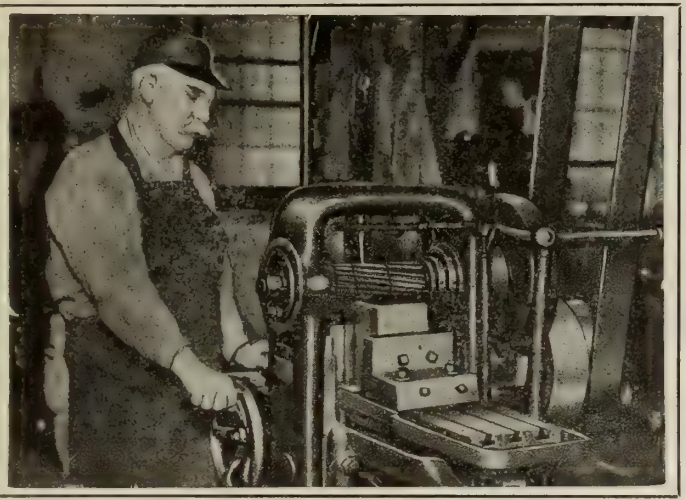
BRIGGS MILLER

Keeps Five Die Sinkers Going



HERE you see the Briggs Miller Squaring Die Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

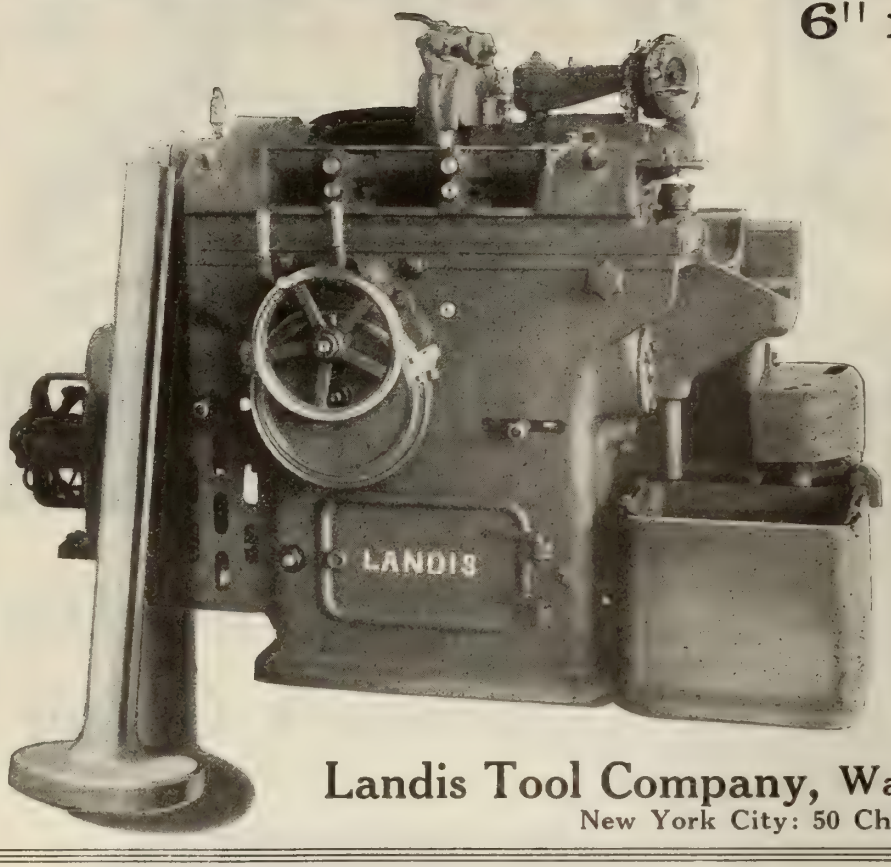
140 Valve Stems per Hour on the "LANDIS" 6" x 18" Grinding Machine



ONE enthusiastic user calls this tool "the biggest little machine on the market." It is a great little producer, compact, sturdy and accurate.

The stems of these valves require finishing within .00025" limits. The Landis does this easily, using a 4-inch face wheel requiring a traverse of only 3/8" to cover the stem and at a speed of 140 valve stems per hour.

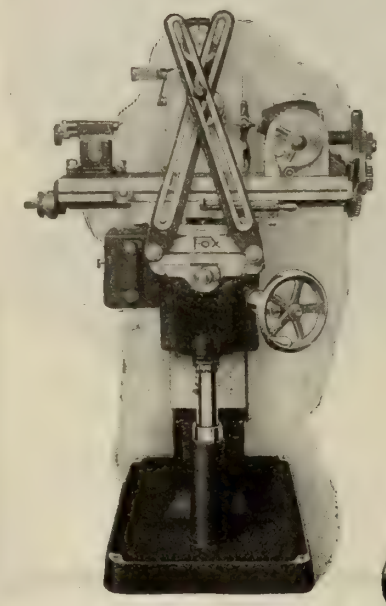
MILLING MACHINES

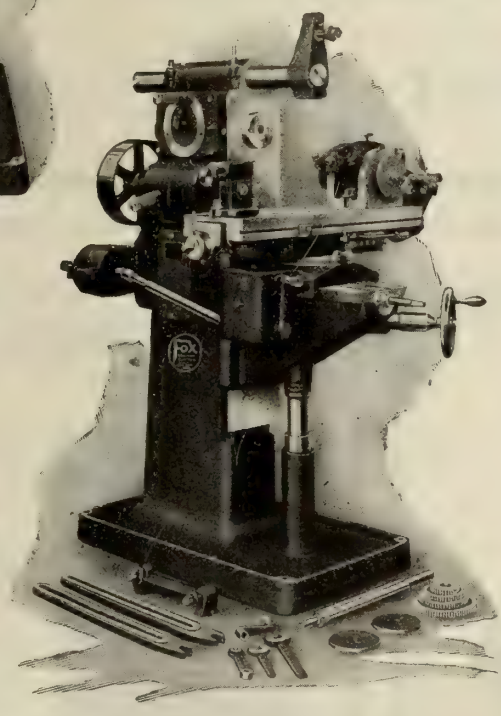
FOR

Rapid Production of Motor Parts



The **demand** for increased production **requires tools** of **great strength** and **durability**; the Fox 2-A Universal Milling Machine illustrated has met this demand, and is being used wherever extreme accuracy and quantity production are required.

The machine has a universal table, spiral cutting attachment, 10″ Dividing Head with 6″ Universal Chuck, making it a machine **especially adapted for Tool Room Work.**



The **United States Government** used this machine in its various **repair shops** for **Aeroplane Motors.**

You should be using this tool to help the production of parts necessary for reconstruction.

Specifications—No. 2-A Miller.

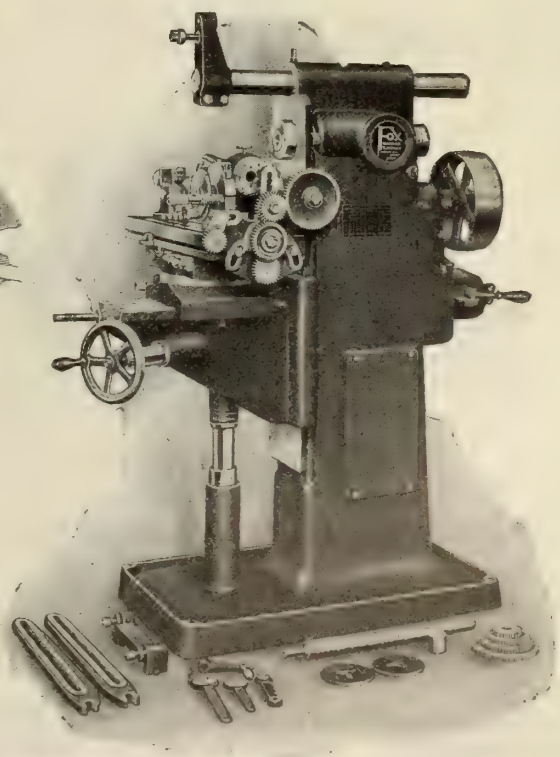
Spindle speeds 12
From 21 to 423 r.p.m.

Table feeds 6
From .317″ to 2.79″ per min.

Table .....8½ x 27″
Long. feed (power) 26″.
Vertical feed (hand) 13″.
Trans. feed (hand) 8½″.

Drive...Single pulley 10 x 3″ running 250 r.p.m.

Gears — Hardened steel.
Weight .....1,500 lbs.



We build this same machine with a plain table, omitting the spiral cutting attachment and Dividing Head.

Our No. 1 type machine has a four-step cone drive, and while being a lighter machine is a "bear" for work. This was proven by **the hundreds of them in the largest munitions plants.**

We also build the Fox Multiple Spindle Drilling Machines.

FOX MACHINE COMPANY

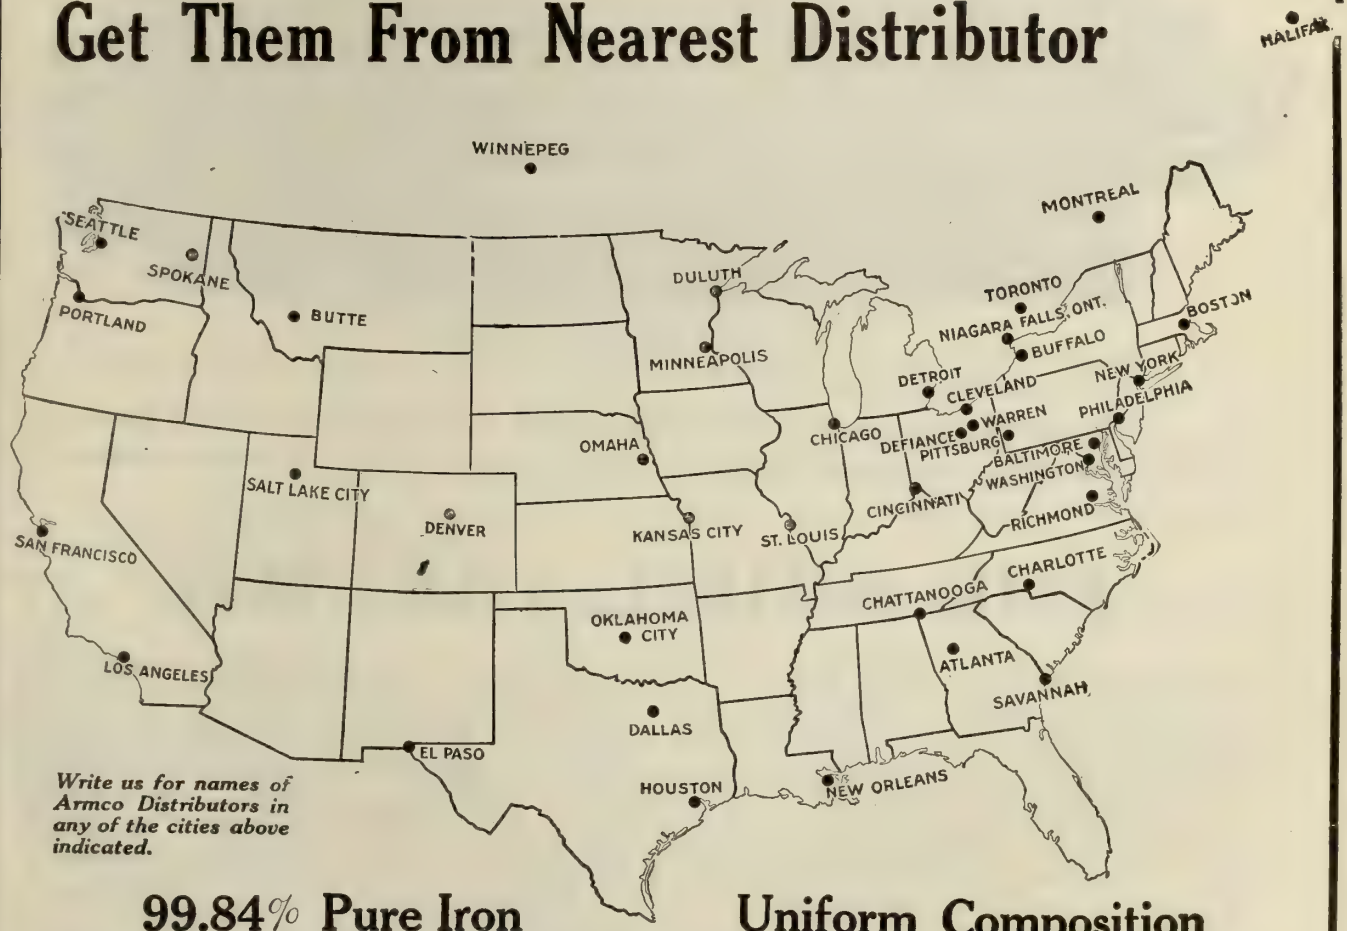
ARMCO IRON WELDING RODS

are steadily increasing in popularity, especially among welders who are building up a reputation for quality of work and reliability. Each new ARMCO enthusiast passes on the word that this strictly American product surpasses in purity and uniformity even the best grades of Norway and Swedish iron. The result is a rapidly growing insistence for ARMCO and our response with the coast-to-coast distribution shown below.

AMERICAN ARMCO INGOT IRON

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by the American Rolling Mill Company with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

Get Them From Nearest Distributor



Write us for names of Armco Distributors in any of the cities above indicated.

99.84% Pure Iron

ARMCO IRON Welding Rods have a guaranteed analysis of 99.84 per cent pure iron content (minimum)—a practical purity which insures complete and uniform cohesion and maximum strength of the welded section. Such purity also makes it possible for two kinds of rods of guaranteed ARMCO analysis, one specially treated for electric and the other for oxy-acetylene, to do all the work (and better work) that heretofore has required a wide range of filler compositions.

Uniform Composition

The uniform composition of ARMCO IRON Welding Rods, as determined before drawing by microscopic and chemical analysis of samples from various parts of split ingots, is another assurance of tough welds that will endure the most severe service and reflect credit upon the welder. This uniformity also insures free flowing of the welding material and a joint that can be hammered, forged, and, when necessary, annealed and quenched. Operators produce their best work when they use ARMCO Rods.

Send for our booklet on Armco Iron Welding Rods. It is full of interesting and useful data.

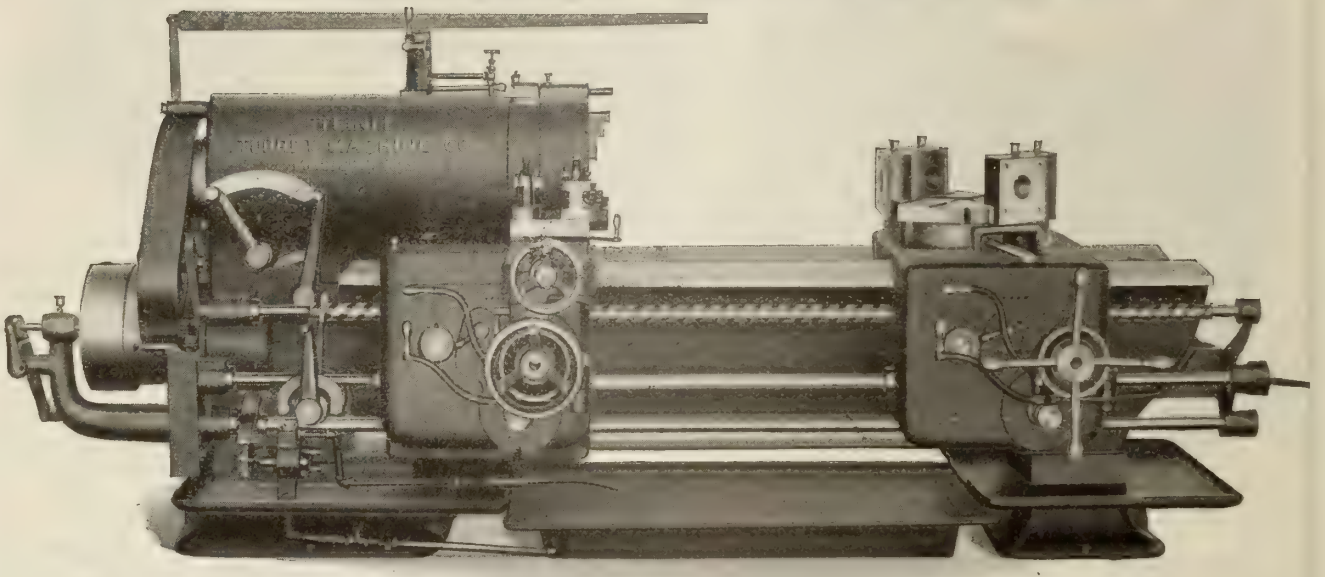
STEINLE



Still another reason why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work.

THE SIDE CARRIAGE

This feature has many advantages over the old style carriage that spans or bridges the ways. It is designed in such a manner that while it can be run past the chuck and permits bringing the turret up close to the work there is no sacrifice of strength or rigidity due to the absence of a bridge across the ways. The side carriage is firmly supported by the massive front way at the top of the bed and secured with a dove-tail gib to a way located at the bottom of the front of the bed. It is thoroughly substantial in design and is equipped with a cross slide having power cross feed, on the top of which slide is mounted a turret block carrying four tool holders. It has power traverse, quick change longitudinal feed, and power cross feed all of which are reversible and controlled from the apron. While this carriage does not span the ways it is so substantially supported that it can be used for most severe service in facing to the centre and similar work such as cutting off heavy bar stock.

All of the advantages of this side carriage feature are not available except where the design of the entire machine has been carried out with a view of utilizing them and in a future issue of this Journal we will describe another feature, the design of which as incorporated in this machine permits of the use of all side carriage advantages.

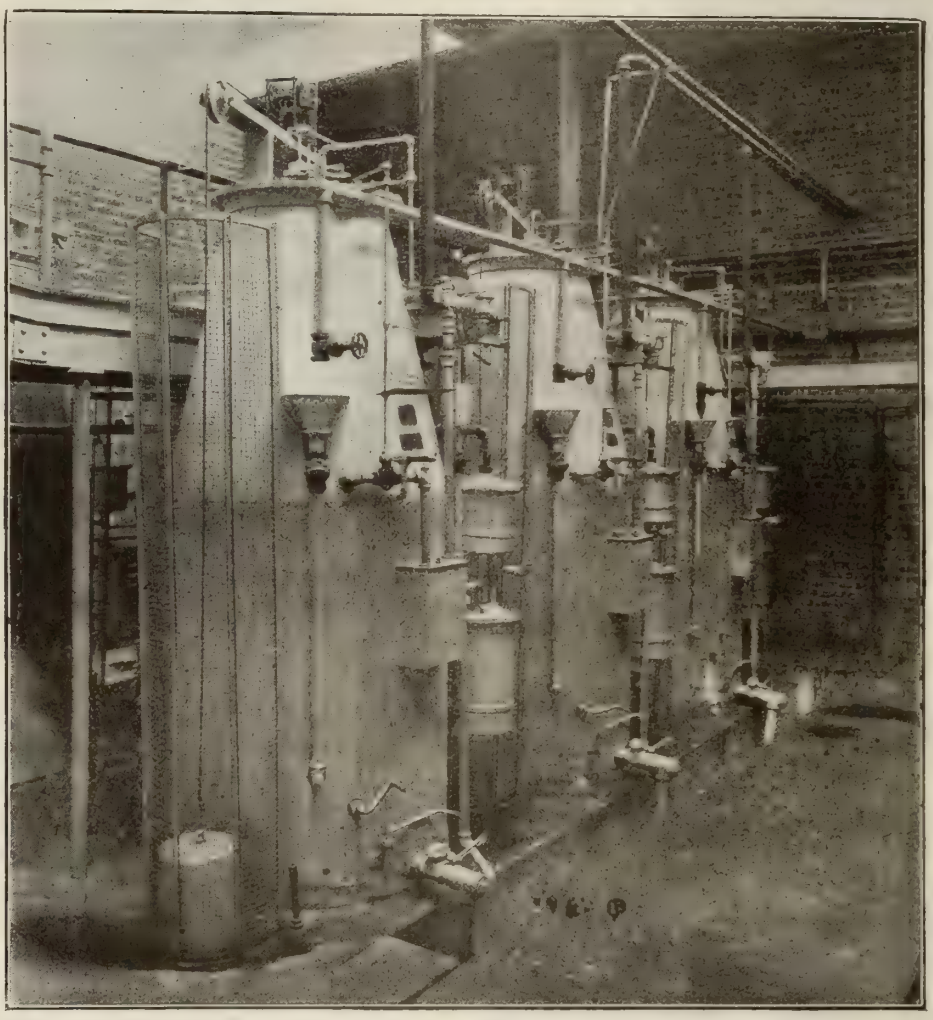
Acetylene For Welding And Cutting

Acetylene is the only efficient gas employed for both cutting and welding of metals. For shop operations and for yard use, with fixed stations, the most economical and satisfactory supply is by generation of acetylene on the premises as it is required, piping the gas under working pressure directly to where it is wanted, avoiding transportation delays, costs, and handling of acetylene tanks, and the necessarily higher cost of the gas. For outside work where portable apparatus is required, the portable acetylene tanks are invaluable.



This illustration shows a bank of three 300-lb. carbide capacity Davis-Bournonville acetylene pressure generators, which is one section of a twelve-generator installation in a metal working plant.

Davis-Bournonville generators are made in several sizes and are frequently installed in batteries of from two to twelve of the largest size. Automatic in operation, and with no additional storage of free acetylene, they provide the highest efficiency in acetylene production. Davis-Bournonville apparatus comprises the widest range of equipment for the production, distribution and application of acetylene, oxygen and hydrogen for welding and cutting.

Subject
The Standard Optical Co..
Geneva, New York.
Gentlemen:
We are in receipt of your letter of May 9th, also the sample pair of Celo-Goggles forwarded us. We have tested out these goggles, and find that they are not satisfactory for our work for several reasons.
First, they do not fit properly over the nose, and around the eyes, and secondly, the cable ear pieces have a tendency to dig in through the back of the ears, and are uncomfortable for the wear.
In our work there is a great deal of flying emery dust, and small particles of steel, which would get in around the places where they do not fit up tight against the face.
We thank you, however, for the attention given our letter of the 6th, and remain
Very truly yours,

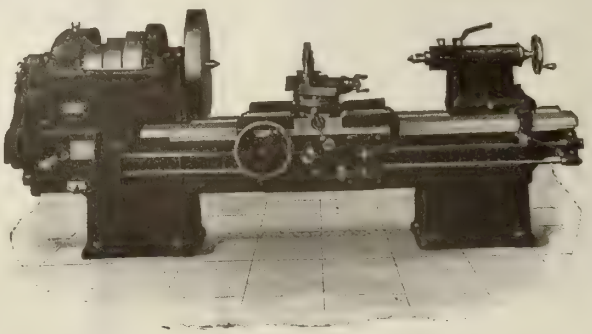
SIDNEY

Sidney for Service

Sidney-for-Service Lathes are noted for their power and rigidity. Take deep cuts through toughest metal without pause or chatter.



Specifications include 3-step cone, double back gear, semi-quick change gear lathe, built on 10 ft. bed. This lathe also furnished with quick-change gears. Bed lengths available: 10, 12, 14, 16, 18 and 20 feet.

The Sidney Line comprises 15-inch, 17-inch, 19-inch, 25-inch, 27-inch, 30-inch and 36-inch lathes, which are adaptable to the finest tool room work or the heaviest duty shipyard or factory rapid production work.

Photographic Copying
The PHOTOSTAT

(Trade Mark Registered)

"Orders are now delivered three or four days earlier to our customers by making photographic copies of sketches and drawings which are the same in every detail instead of having our draftsmen reproduce the original.

"Practically all orders were previously held up three or four days by our drafting department while copies of the intricate drawings of ordered tools were being made. Now with the Photostat, only 15 or 20 minutes are required to make the three copies, exact duplicates of the original, which the factory needs to turn out the order. By eliminating this needless delay we are able to provide better service for our customers, and attract new prospects because of prompt deliveries."

This cut shows a PHOTOSTAT on which a large drawing has just been copied in less than a minute.

Never Makes a Mistake

It is simple, practical, easy to handle. Requires no expert knowledge. The machine is loaded with a roll of sensitized paper especially manufactured for the purpose.

The original subject is photographed directly upon this paper producing a facsimile copy which is immediately cut off, developed and fixed right in the PHOTOSTAT itself.

The focusing, exposing and developing are all controlled by simple mechanical devices and no glass plate, film or other intermediate negative has to be made.

After fixing, the copy is removed to a tank of running water and rapidly washed free from chemicals. It is then dried and is ready for use. As many copies as desired may be run off in this manner.

By a simple adjustment of the mechanical focusing device the copy may be made at actual size, reduced, or enlarged, within the size limitations of the machine.

Error in copy is impossible because every copy is an absolute facsimile. The operations are all simple, such as a boy or girl can do.

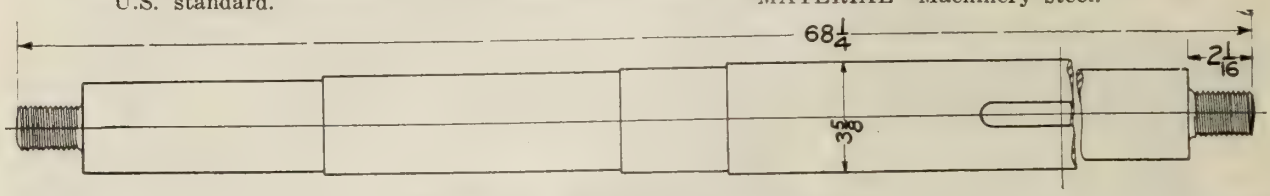
Smalley-General

THREAD MILLING MACHINES

Will give you a short cut to lower-cost thread milling.
Study the blue print and time study as given below.

MACHINE—Smalley-General Thread Miller No. 2.
THREAD—1½ in. diameter, 2 1-16 length, 6 pitch U.S. standard.
PIECE MILLED—Axle for tractor.
MILLING FEED—4.35 per minute.
MATERIAL—Machinery steel.



Tractor Axle Operation
TIME STUDY

5 minutes 37 seconds floor to floor milling both threads. Each thread milled in 65 seconds. Balance of time handling. Barker 3-jaw chuck used which had 12 in. unsupported overhang turn main spindle bearing to thread.

NOTE.—These parts were chucked through the rear end of main spindle. This was an awkward operation because the pieces were larger in the centre and the type of chuck would not let them through. A collet chuck with false collets would have permitted faster chucking.

Consult us on every phase of Thread Milling.

We will show you how to cut the costs.

Smalley - General Co., Inc., Bay City, Michigan

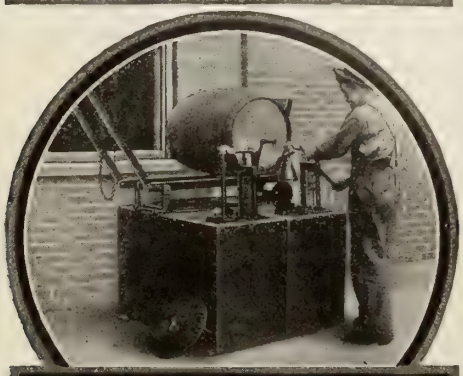
Tiresome, Expensive, Dangerous, Wasteful—but Unnecessary.



With Bowser Equipment One Man Does the Work with Less Time and Effort —and Without Loss

STOP WASTING LABOR IN HANDLING OILS

Do away with the back-breaking, disagreeable labor in storing and handling oils.

With Bowser Storage Equipment the heavy work is done mechanically—there is no wasted energy—all oils are easily and quickly put into storage by gravity.

Save With BOWSER Systems

Distribution is done by accurate, rapid self-measuring pumps—no oils are left in shipping containers to dry up, leak and seep away—none is lost through spilling or dripping faucets. Every operation in the use of oils is done in a systematic, safe and saving manner.

Write us for literature, showing why Bowser Systems are a paying investment

Nichrome Castings for Heat Treatment

Cast "Nichrome" and Ferrous Materials at High Temperatures

There is an excessive reduction in the physical strength of ferrous materials after subjected to high temperatures.

In one set of experiments wrought iron had a tensile strength at 1700°F. of 6300 lbs. per square inch, less than 15% of its normal strength at 70°F. At 1700°F. cast iron had a tensile strength of 7900 lbs. per square inch. That is, it had lost 58% of its normal strength at 70°F.

The tensile strength of cast Nichrome at 1700°F. is 24,500 lbs. per square inch, approximately 210% greater than the tensile strength of cast iron at 1708°F. When cold, Nichrome has a tensile strength of about 45,000 to 50,000 lbs. per square inch.

The durability of cast Nichrome makes the use of Nichrome boxes, pots, tubes and retorts economical for heat treating work and for all operations occuring at high temperatures.

Write for further particulars.

CHUCKS

RAISED!

"Those Chapman Bearings have been such a big saving, Bill, that I guess you are due for a raise for persuading us to put them in."

This was the conversation of one boss to his foreman.

You too will find it to your interest to find out how much Chapmans will save in your plant. Write us stating:

1. **About how many hangers you have,**
2. **Kind of bearings with which they are equipped,**
3. **Horsepower used,**
4. **Kind of power—steam, electric or gas,**
5. **Whether you are or are not carrying an overload, and if so, how much.**

Records taken where plants have changed from babbitted to Chapman Ball Bearings show a 15-40% saving of the total power. They pay for themselves within two years. **In some plants they have saved enough in power, lubrication and attention to pay for themselves in six months.**

Figure out what a saving of 15% would mean in your plant, then sit down now, or tonight at home, and send us the above information. Help yourself by helping your firm.

Send the above information and ask for catalogue 3-B.

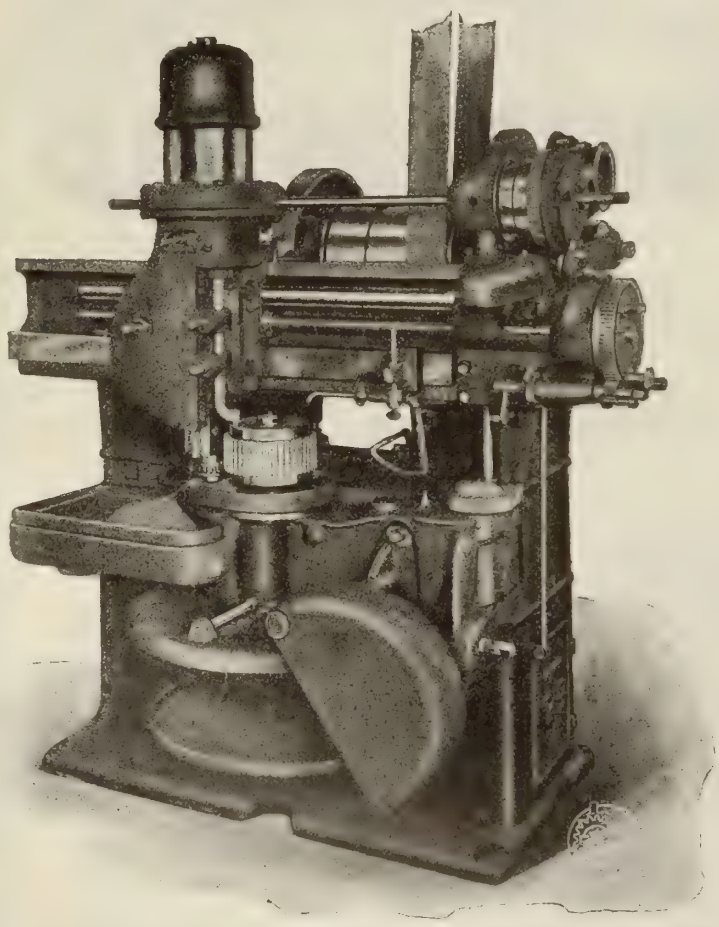
Gear Cutting for Profit

Every business undertaking must in the end stand or fall on its answer to the question "Does it pay?" The gear cutting business is no exception to this rule. The theoretical beauty or mechanical ingenuity of any scheme will not save it. If it is to excell as a business proposition, it must also excell as a profit earner.

Incorporated in the Fellows Gear Shaper are four of the necessary essentials for profitable gear cutting, which we might term: **accuracy, uniformity, output** and **adaptability.**

Accuracy: The Gear Shaper Cutter is an original cutter generated by grinding after hardening. It is not copied from any templet, each cutter being a master tool of great accuracy.



Fellows Spur Gear Shaper, adapted to the cutting of both internal and external gears, as well as being capable of handling a large range of other work.

Uniformity: All Gear Shaper Cutters are alike as far as accuracy is concerned, because all "hand and eye" methods of manufacture are eliminated. The Gear Shaper is so constructed that it uses this accurate cutter to the best possible advantage.

Output: The question of output is inherent in the Gear Shaper process, and is implanted in the design of the machine.

Adaptability: The Gear Shaper will cut external or internal spur gears, shoulder gears, cluster gears, and, in addition, will handle a large range of work that cannot be cut on any other type of gear cutting machine.

The Gear Shaper stands in a class by itself, and excells as a profit earner for large and small users of gears alike. It is just as much at home in the small jobbing shop as it is in the large manufacturing plant, turning out thousands of gears.

Further information regarding the many advantages of this type of machine can be obtained from our general catalogue, "Commercial Gear Cutting," a copy of which we will gladly send to those interested.

FRANKLIN DIE-CASTINGS

Machining small parts wastes stock and requires expensive skill.

Die-castings are cheaper, and often better where their use is advisable.

As the originators of die-castings we have probably helped decide, more than any other concern, where die-castings could be used in different and difficult products.

We will help you with any problem you may have.

We are prepared to quote on Die-castings in Aluminum, Lead, Tin and Zinc base alloys.
You may gain knowledge as to die-casting possibilities by sending for our Booklet "C."
A sample part, or a blue print enables us to make report and recommendations to you. Write us.

Williams' Drop-Forged Clamps

CAST Clamps may cost less, but they are not cheaper—first cost is not the only factor to be considered. No cast clamp can, or does, stand the constant strain of severe usage.

Williams' Clamps are all drop-forged and are then subjected to a refining heat-process which greatly increases their stiffness and strength. They are thoroughly dependable and render superior service under the hardest and most exacting conditions.

Williams' lines of "C" Machinists' and Scrap Clamps provide a wide range of sizes for all clamping service. "There's a Williams' Clamp for every purpose." They are carried by leading dealers and are all fully guaranteed.

A copy of our Machinists' Tools Booklet will be sent on request.

End Transmission Losses

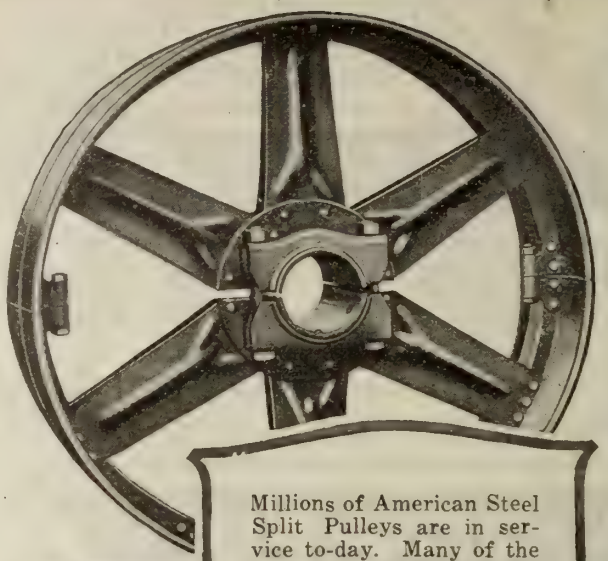
Air resistance and belt slip are wasting a lot of power and coal in many plants where quite a number of pulleys are employed. American Steel Split Pulleys, the only pulleys with grooved faces for air escape, can check these losses. They are guaranteed for minimum air resistance and belt slip.

AMERICAN STEEL SPLIT PULLEYS

These pulleys are constructed to give maximum strength with light weight. They are guaranteed for double belt duty, recommended for high rim speeds and are very easy to install. Any pulley failing in service from any defect in material or manufacture will be replaced.

Write for free book, "Getting Maximum Pulley Efficiency," a valuable treatise on Pulleys

The American Pulley Company
PHILADELPHIA, PA.



Millions of American Steel Split Pulleys are in service to-day. Many of the largest plants in the country are equipped with them.

"Americans" are distributed through supply houses from parent stocks in New York, Chicago, Philadelphia, Boston, New Orleans, San Francisco, Seattle.

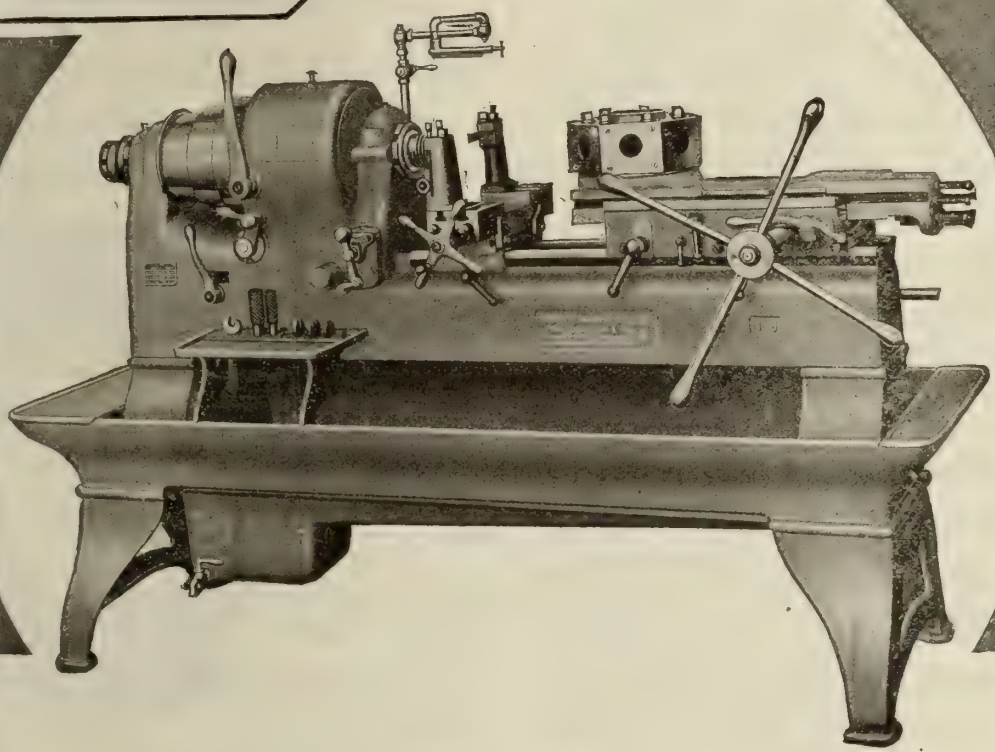
Brown & Sharpe
Plain
Screw Machines



No. 6

THE No. 6 Plain Screw Machine is one of the most popular machines in the modern shop. It is readily adaptable to the working of cast iron, machine steel or metals of this character.

The rugged design and wide range makes it suitable to a wide variety of work. The convenient location of all operating levers combined with independent feeds and speeds make it a primary support in keeping up production.

Let us tell you more in detail about

Brown & Sharpe Plain Screw Machines

Catalog 21-G features the big points.

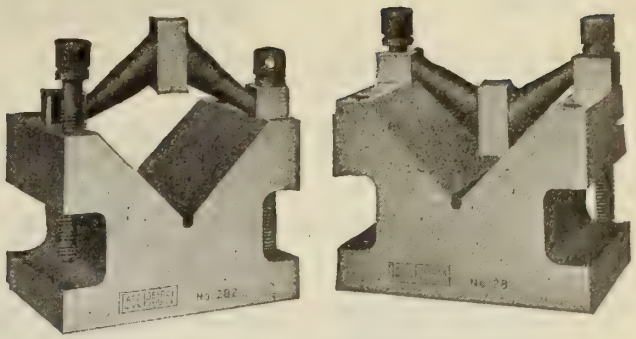
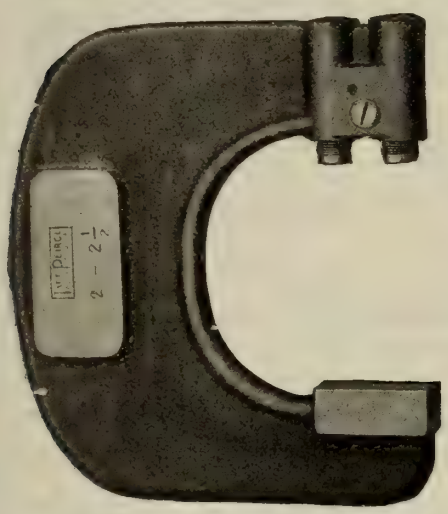
Standardized Tool-Room Equipment



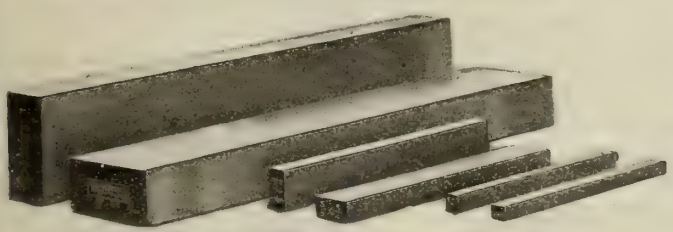
V Blocks—Style 130 –Assembled with Clamps

No modern shop can afford to give valuable time to the production of the miscellaneous tool-room equipment now required for testing and working purposes. Besides diverting real production time, it results in a varied assortment of tools, the duplication of which in the ordinary shop would entail great inconvenience and loss of time.



Adjustable Gage—Style 32

Limit Plug Gage—Style 10



Steel Parallels—Style 150

The Taft-Peirce standardized line of shop and tool-room equipment represents the latest and best design and the highest degree of accuracy. Specials are made to order and duplicate of standard pieces can be promptly shipped. We offer you a service that will put your shop efficiency on a higher plane of excellence than ever before.

Bulletin No. 104-E describes the complete line.

2074

Thor

CHIPPING HAMMERS

Drilling in concrete with a size D hammer with a hexagon nozzle. Will drill a hole one inch in diameter, at the rate of one inch per minute.

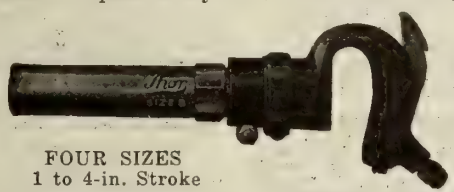
Thor Predominates wherever chippers are used because:

1st. The main valve is large in size and durable, being of the balanced type and having a bearing surface of three square inches.

2nd. Two square inches of the bearing surface retain the lubrication constantly, as no air passes over to blow the oil off.

3rd. The handle is equipped with a self-seating throttle valve, which eliminates all leaks.

4th. The barrel and all working parts are hardened and ground and the hammer is practically free from vibration.



FOUR SIZES
1 to 4-in. Stroke

Riveting Base Plates with size B hammer. Let our service engineer call at your plant and explain the various uses to which these hammers can be adapted, and how to obtain the best results on your particular work.

INDEPENDENT PNEUMATIC TOOL COMPANY

Production of Rare Quality at Lowest Labor Costs

There is unusual strength, accuracy, speed, convenience and range in

AURORA

Drilling Machines

You can use them to great advantage on any work in your shop that's suitable for a machine tool of this kind. The operating is easy and the labor cost comparatively low.

Drop a line for full particulars and specifications.

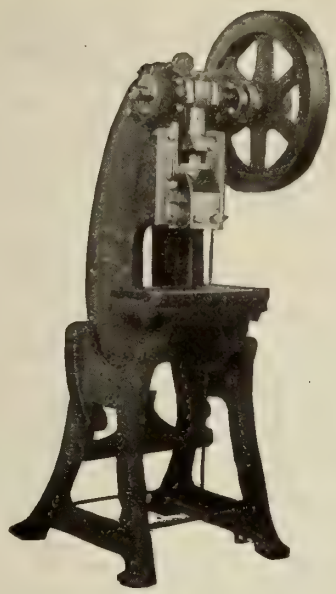
CONSOLIDATED

All the energy of America's most modern machine shop and foundry is concentrated upon one product.

—

CONSOLIDATED POWER PRESSES



CONSOLIDATED PRESS CO.

HASTINGS - MICHIGAN
U. S. A.

CONSOLIDATED

For trimming, stamping forging, punching, embossing.

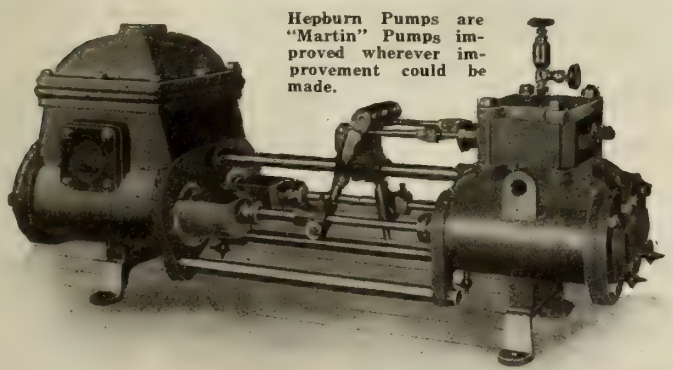
Special presses are designed where the customer's requirements are unusual.

—

CONSOLIDATED POWER PRESSES

Hepburn Pumping Machinery

Our line embraces standard duplex pumps for boiler feeding and for fire and general service; tank or low service duplex pumps; duplex hydraulic pumps for service in connection with hydraulic lifts and presses, accumulators and oil presses; pressure or mine pumps; horizontal power pumps and air and circulating pumps, etc.

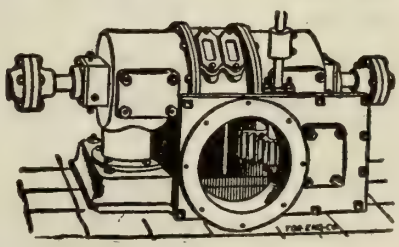


Hepburn Pumps are "Martin" Pumps improved wherever improvement could be made.

JOHN T. HEPBURN, LIMITED

18-60 Van Horne Street Toronto, Ontario

WATER POWER DEVELOPMENT



Over forty years' experience in designing and installing special turbines, both on vertical and horizontal shafts.

Can supply complete equipment, including flume, turbine and power transmission.

Stock of standard vertical shaft Little Giant Turbines on hand for prompt shipment.

We solicit your inquiries.

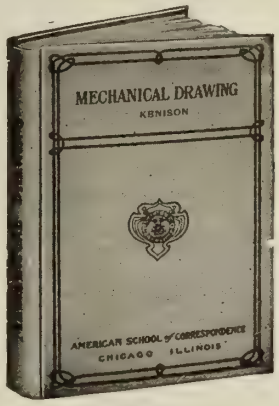
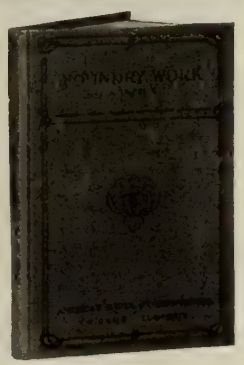
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

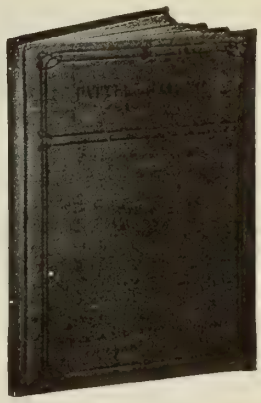
MACHINE-SHOP WORK. By **Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price $2.00



MECHANICAL DRAWING. By **Ervin Kenison, S.B.,** Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.25



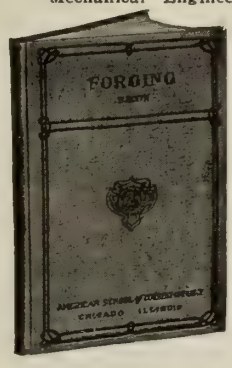
FOUNDRY WORK. Revised by Burton L. Gray, instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, $1.25



PATTERN MAKING. By **James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price.....$1.75

MACHINE DESIGN. By **Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price ... $1.75

TOOL MAKING. By **Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.75



FORGING. By **John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.25

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

Technical Book Department

MacLean Publishing Company **143 University Ave., Toronto**

ROOF COOLERS
Electric Steels & Metals, Ltd., Welland.

ROLLS, CRUSHING
Can. Link-Belt Co., Toronto.

RUBBER MILL DRIVES
Can. Link-Belt Co., Toronto.

RUBBER MILL MACHINERY
Bertrams Ltd., Edinburgh, Scotland.

RULES
Brown & Sharpe Mfg. Co., Providence.
James Chesterman & Co., Ltd., Sheffield.
Rice, Lewis & Son, Toronto.
L. S. Starrett Co., Athol, Mass.

RULES, STEEL, STRAIGHT, AND FOLDING
Lufkin Rule Co. of Can., Windsor.

RULES, BOXWOOD, FOLDING
Lufkin Rule Co. of Can., Windsor.

RULES, BOARD AND LONG
Lufkin Rule Co. of Can., Windsor.

SAW MILL CONVEYORS
Can. Link-Belt Co., Toronto.
Williams & Wilson, Ltd., Montreal, Que.

SAFETY DEVICES
Strong, Kennard & Nutt Co., Cleveland.

SAND MILLS
Frost Mfg. Co., Chicago, Ill.

SAND-BLAST EQUIPMENT SAND BLAST SUPPLIES AND ACCESSORIES
Pangborn Corporation, Hagerstown, Md.

SAFETY APPLIANCES
Strong, Kennard & Nutt Co., Cleveland.

SAFETY APPLIANCE GOGGLES
T. A. Willson Co., Inc., Reading, Pa.

SAND BLAST ABRASIVES
Pangborn Corporation, Hagerstown, Md.
Pittsburgh Crushed Steel Co., Pittsburgh.

SAND MIXING MACHINERY
Frost Mfg. Co., Chicago, Ill.

SANITARY DRINKING FOUNTAINS
Puro Sanitary Drinking Fountain Co., Haydenville.

SANDERS, DISC AND SPINDLE
Can. Sander Mfg. Co., Brockville, Ont.

SANDING MACHINES
Canada Machinery Corp., Galt.
Can. Sander Mfg. Co., Brockville, Ont.

SAW MILL MACHINERY
Can. Fairbanks-Morse Co., Montreal.
Canada Machinery Corp., Galt.
Robert Gardner & Son, Montreal.
Curtis Pneumatic Machy Co., St. Louis.
A. R. Williams Machy. Co., Toronto.
Williams & Wilson, Ltd., Montreal, Que.

SASH SPRINGS
The Dunbar Brothers Co., Bristol, Conn.

SAWS, CIRCULAR METAL
Wm. Atkins & Co., Ltd., Sheffield, Eng.
Hunter Saw & Machine Co., Pittsburgh.
Marshal, Son & Bunney, Toronto.
Plewes Ltd., Winnipeg, Man.
Simonds Mfg. Co., Fitchburgh, Mass.
Tabor Mfg. Co., Philadelphia, Pa.

SAWS, HACK (See Hack Saws)

SAW SHARPENERS
Greenfield Tap & Die Corp., Greenfield.
Hunter Saw & Machine Co., Pittsburgh.
Wells Bros. of Can., Galt, Ont.

SAWS, SLITTING
J. A. M. Taylor, Stair Bldg., Toronto.

SCALES, MECHANICS'
Lufkin Rule Co. of Can., Windsor.

SCLEROSCOPES
Shore Instrument & Mfg. Co., New York.

SCREENING MACHINERY
Can. Link-Belt Co., Toronto.

SCREW EXTRACTORS
Cleveland Twist Drill Co., Cleveland.

SCREW MACHINES, HAND, AUTOMATIC
Brown & Sharpe Mfg. Co., Providence.
Can. Fairbanks-Morse Co., Montreal.
Foster Machine Co., Elkhart, Ind.
Garlock-Walker Machy. Co., Ltd., Toronto
Garvin Machine Co., New York.
Greenfield Tap & Die Corp., Greenfield.
A. B. Jardine & Co., Hespeler.
National Acme Co, Cleveland, Ohio.
Pratt & Whitney Co., Dundas, Ont.
Wells Bros. of Can., Galt, Ont.
Warner & Swasey Co., Cleveland, O.
A. R. Williams Machy. Co., Toronto.
Wood Turret Mach. Co., Brazil, Ind.
Williams & Wilson, Ltd., Montreal, Que.

SCREWS, MACHINE, SET, CAP AND SPECIAL
Galt Machine Screw Co., Galt.
John Morrow Screw & Nut Co., Ingersoll.
National Acme Co., Montreal.
Rice Lewis & Son, Toronto.
Steel Co. of Canada, Ltd., Hamilton.
Wilkinson & Kompass, Hamilton.

SCREW COLLARS
Galt Machine Screw Co., Ltd., Galt, Ont.
John Morrow Screw & Nut Co., Ingersoll.

SCREW PLATES
Butterfield & Co., Rock Island, Que.
Greenfield Tap & Die Corp., Greenfield.
A. B. Jardine & Co., Hespeler.
Morse Twist Drill & Mach. Co., New Bedford, Mass.
Rice Lewis & Son, Toronto.
J. A. M. Taylor, Stair Bldg., Toronto.
Wells Bros. of Can., Galt.
Wilkinson & Kompass, Hamilton.

SCREWS, SAFETY SET
Galt Machine Screw Co., Ltd., Galt, Ont.

SCREW SLOTTERS
Garvin Machine Co., New York.
National Acme Co., Cleveland, O.
Pratt & Whitney Co., Dundas, Ont.

SEPARATATORS, MOISTENERS AND OIL FOR COMPRESSED AIR
Pangborn Corporation, Hagerstown, Md.

SELF-OPENING DIES
See Dies.

SEPARATORS, SAND
Pangborn Corporation, Hagerstown, Md.

SET SCREWS, SAFETY
Aikenhead Hardware Co., Toronto.
Bristol Co., Waterbury, Conn.
J. Morrow Screw & Nut Co., Ingersoll, Ont.
Wilkinson & Kompass, Hamilton.

SHANKS, STRAIGHT AND TAPER
Jacobs Mfg. Co., Hartford, Conn.

SHAPERS
John Bertram & Sons Co., Dundas.
Can. Fairbanks-Morse Co., Montreal.
Canadian Machinery Corp., Galt.
Geo. F. Foss Mchy. & Sply. Co., Montreal
Robt. Gardner & Son, Montreal.
Garlock-Walker Mach'y. Co., Toronto.
Hendey Machine Co., Torrington, Conn.
Hamilton Mach. Tool Co., Hamilton.
Williams & Wilson, Ltd., Montreal.

SHAPERS, GEAR
Fellows Gear & Shaper Co., Springfield, V.

SHAFTING
Algoma Steel Corp., Sault Ste. Marie, O.
Can. Fairbanks-Morse Co., Montreal.
Garlock-Walker Machy. Co., Ltd., Toronto
Jones & Glassco, Montreal.
Niles-Bement-Pond Co., New York.
Can. Drawn Steel Co., Hamilton.
Pratt & Whitney Co., Dundas.
Rice, Lewis & Son, Toronto.
A. R. Williams Machy. Co., Toronto.
Wilkinson & Kompass, Hamilton, Ont.
Wilson & Co., J. C., Belleville, Ont.
Williams & Wilson, Ltd., Montreal, Que.

SHARPENING STONES
Norton Co, Worcester, Mass.
Rice, Lewis & Son, Toronto.

SHEARING MACHINES, ANGLE IRON, BAR AND GATE
John Bertram & Sons Co., Dundas.
Bertrams Ltd., Edinburgh, Scotland.
Canada Machinery Corp., Galt, Ont.
Garlock-Walker Machy. Co., Ltd., Toronto
A. B. Jardine & Co., Hespeler, Ont.
Niles-Bement-Pond Co., New York.
Toledo Machine & Tool Co., Toledo, O.

SHEARS, POWER
John Bertram & Sons Co., Dundas.
E. W. Bliss Co., Brooklyn, N.Y.
Brown, Boggs Co, Ltd., Hamilton.
Can Blower & Forge Co, Kitchener.
Canada Machinery Corp., Galt, Ont.
Garlock-Walker Machy. Co., Ltd., Toronto
Long & Allstatler, Hamilton, Ohio.
Wickes Bros., Saginaw, Mich.
A. B. Jardine & Co., Hespeler, Ont.
National Machy. Co., Tiffin, Ohio.
Niles-Bement-Pond Co., New York.
H. D. Stoll Co., Inc., Buffalo, N.Y.
Toledo Machine & Tool Co., Toledo, O.
Williams & Wilson Ltd., Montreal, Que.

SHEARS, ROTARY
The Quickwork Co., St Mary's, Ohio.

SHEARS, PNEUMATIC
Toledo Machine & Tool Co., Toledo, Ohio.

SHEET METAL ROLLING MACHINES
Peck, Stow & Wilcox Co., Southington.

SHEETS, NICKEL, RESIST. ALLOY
Can. Driver-Harris Co., Ltd., Walkerville.

SHEARS, PLATE CUTTING, SLITTING
Quickwork Co., St. Mary's, Ohio.

SHEARS, SPLITTING
Peck, Stow & Wilcox Co., Southington.

SHEARS, IRREGULAR AND CIRCLE CUTTING
The Quickwork Co., St. Mary's, Ohio.
D. H. Stoll Co., Inc., Buffalo, N.Y.

SHEET METAL MACHINERY
Peck, Stow & Wilcox Co., Southington, O.

SHEARS, SERPENTINE
The Quickwork Co., St. Mary's, Ohio.

SHEARS, SQUARING
Brown, Boggs & Co., Hamilton, Ont.
D. H. Stoll Co., Inc., Buffalo, N.Y.

SHEET METAL WORKING TOOLS
Baird Machine Co., Bridgeport, Conn.
E. W. Bliss Co., Brooklyn, N.Y.
Brown, Boggs & Co., Hamilton.
Peck, Stow & Wilcox Co., Southington, C.
D. H. Stoll Co., Inc., Buffalo, N.Y.
Williams & Wilson, Ltd., Montreal.

SHEETS, CRUCIBLE, CAST
Kayser-Ellison & Co., Ltd., Montreal.
Ralph B. Norton, Agent, Montreal.

SHEET METAL WORKING MACHINERY
D. H. Stoll Co., Inc., Buffalo, N.Y.

SHELVING, STEEL
Dennis Wire & Iron Works, London.

SHIPYARD MACHINERY, SHOP FURNITURE
Dennis Wire & Iron Works, London.

SIDE TOOLS
Armstrong Bros. Tool Co., Chicago.
J. H. Williams & Co., Brooklyn, N.Y.

SILENT CHAINS
Can. Link-Belt Co., Toronto, Ont.
Jones & Glassco, Montreal.

SLEDGES
Aikenhead Hardware Co., Toronto, Ont.
Rice Lewis & Son, Toronto, Ont.
Whitman & Barnes Mfg. Co., St. Catharines, Ont.
Wilkinson & Kompass, Hamilton, Ont.

SLEDGES, CAST IRON
Katie Foundry, Galt, Ont.

SLINGS, CHAINS
Morris Crane & Hoist Co., Herbert, Niagara Falls, Ont.

SLOTTERS
Betts Machine Co., Rochester, N.Y.
Garvin Machine Co., New York.
National-Acme Co., Cleveland, Ohio.
Niles-Bement-Pond Co., New York.

SMOKESTACKS
MacKinnon Steel Co., Sherbrooke, Que.

SNIPS, TINNERS AND SHEET METAL WORKERS
Kearney & Trecker Co., Milwaukee, Wis.
J. Morrow Screw & Nut Co., Ingersoll, Ont.

SOCKETS
Brown & Sharpe Mfg. Co., Providence.
Cleveland Twist Drill Co., Cleveland.
Keystone Mfg. Co., Buffalo, N.Y.
Modern Tool Co., Erie, Pa.
J. Morrow Screw & Nut Co., Ingersoll, Ont.
Morse Twist Drill & Mch. Co., New Bedford, Mass.
Rice Lewis & Son, Toronto, Ont.
Whitman & Barnes Mfg. Co., Akron, O.

SOIL PIPE FITTINGS, CAST IRON
Katie Foundry, Galt, Ont.

SOLDERING IRONS
Aikenhead Hardware Co., Toronto, Ont.
Brown, Boggs & Co., Hamilton, Ont.
Prest-O-Lite Co., Inc., Toronto, Ont.
Rice Lewis & Son, Toronto, Ont.

SOLDER
Aikenhead Hardware Co., Toronto, Ont.
Canada Metal Co., Ltd., Toronto, Ont.
Rice Lewis & Son, Toronto, Ont.
Tallman Brass & Metal Co., Hamilton.

SPEED REDUCING GEARS
Can. Link-Belt Co., Toronto, Ont.
Jones & Glassco, Montreal.

SLICING CLAMPS
Peck, Stow & Wilcox Co., Southington, Conn.

SPRINGS, MACHINERY
Barnes, Wallace Co., Bristol, Conn.
Can. Steel Foundries, Ltd., Montreal.
Cleveland Wire Spring Co., Cleveland.
Dunbar Bros. Co., Bristol, Conn.
Garlock-Walker Machinery Co., Toronto.
Jas. Steele, Ltd., Guelph, Ont.

SPECIAL MACHINERY
Baird Machine Co., Bridgeport, Conn.
Banfield, W. H., & Sons, Toronto.
Bertram, John, & Sons Co., Dundas.
Bliss, E. W. Co., Brooklyn, N.Y.
Brown, Boggs & Co., Hamilton, Canada.

Victoria Foundry Co., Ottawa, Ont.
Wilson & Co., J. C. Belleville, Ont.
William R. Perrin, Ltd., Toronto.
Windsor Mach. & Tool Co., Windsor, Ont.

SPRING COILING AND WINDING MACHINERY
Baird Machine Co., Bridgeport, Conn.
Garvin Machine Co., New York.
Sleeper & Hartley, Inc., Worcester, Mass.

SPRING MAKING MACHINERY (AUTOMATIC)
Baird Machine Co., Bridgeport, Conn.
Sleeper & Hartley, Inc., Worcester, Mass.

SPRINGS, SPIRAL, TOOL
The Dunbar Bros. Co., Bristol, Conn.

SPROCKETS, COMPENSATING
Morse Chain Co., Ithaca, New York.

SPROCKETS, SPRING
Morse Chain Co., Ithaca, New York.

SPROCKETS, CHAIN
Can Link-Belt Co., Toronto, Ont.
Grant Gear Works, Boston, Mass.
Jones & Glassco, Montreal.
Morse Chain Co., Ithaca, N.Y.
Philadelphia Gear Works, Philadelphia.
Wilson & Co., J. C., Belleville, Ont.

SPRINGS FOR TOYS AND ELECTRIC DEVICES
The Dunbar Bros. Co., Bristol, Conn.

SPROCKET WHEELS, CAST
Can. Link-Belt Co., Toronto, Ont.
Perrin, Wm. R., Toronto.
Wilson & Co., J. C., Belleville, Ont.

SPROCKET WHEELS, CHILLED THREAD
Katie Foundry, Galt, Ont.

SQUARES
Peck, Stow & Wilcox Co., Southington, Conn.

SAFETY CYLINDERS
Oliver Mach. Co., Grand Rapids, Mich.

SANDERS
Oliver Mach. Co., Grand Rapids, Mich.

SAW BENCHES
Oliver Mach. Co., Grand Rapids, Mich.

SAW GUARDS
Oliver Mach. Co., Grand Rapids, Mich.

SAWS SWING
Oliver Mach. Co., Grand Rapids, Mich.

STAYBOLT TOPS
Greenfield Tap & Die Corp., Greenfield, Mass.
Wells Bros. of Can., Galt, Ont.

STAIRS, IRON
Canada Wire & Iron Goods Co., Hamilton, Ont.

STAMPINGS, SHEET BRASS, COPPER, ALUMINUM AND STEEL
Dom. Forge & Stamping Co., Walkerville
Hope & Sons, Henry, of Canada, Peterboro, Ont.
Homer & Wilson, Hamilton, Ont.

STAMPING MACHINERY
Bliss Co., E. W., Brooklyn, N.Y.
Brown, Boggs, & Co., Hamilton, Can.
Canada Machinery Corp., Galt, Ont.

STAMPS, STEEL ALPHABET, FIGURES
Matthews, Jas. H & Co., Hartford, Conn.
Pritchard-Andrews Co., Ottawa, Can.

SAFETY CYLINDERS
Oliver Mach. Co., Grand Rapids, Mich.

STAPLE MACHINES
Sleeper & Hartley, Inc., Worcester, Mass.

STEAM APPLIANCES
Darling Bros., Ltd., Montreal, Quebec.

STEAM SEPARATORS AND TRAPS
Can. Fairbanks-Morse Co., Montreal.

STEEL BALLS
See Balls Steel.

STEEL, CRUCIBLE TOOL
Atkins & Co., Ltd., Wm. Sheffield, Eng.
Illingworth Steel Co., John, New York.
Kayser-Ellison & Co., Ltd., Montreal.
Marshall, Son & Bunney, Toronto.
Norton, Ralph B., Agent, Montreal.

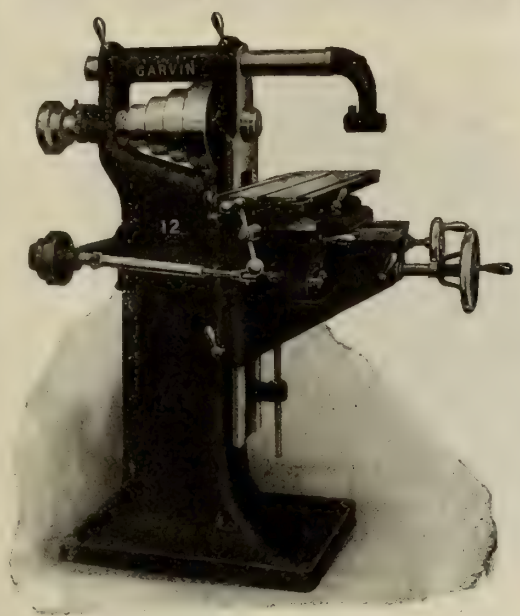
GARVIN



No. 12 Plain Milling Machine-Use Code Abrade

NO. 12 PLAIN MILLING MACHINE

FOR ALL LIGHT MANUFACTURING

This machine is built especially strong and substantial for a tool of its capacity, and has many valuable features worthy of special mention. The slide is fitted with a quick pitch screw, giving one inch per turn. This combines the rigidity of a rack feed with the steadiness of the screw feed. The table has an oil pan all around it, with finished edges—automatic feed, trip and reverse—adjustable nut on the feed screw to take wear—the Feed Screw is hardened.

Adjustments .....18 x 6 x 15 in.

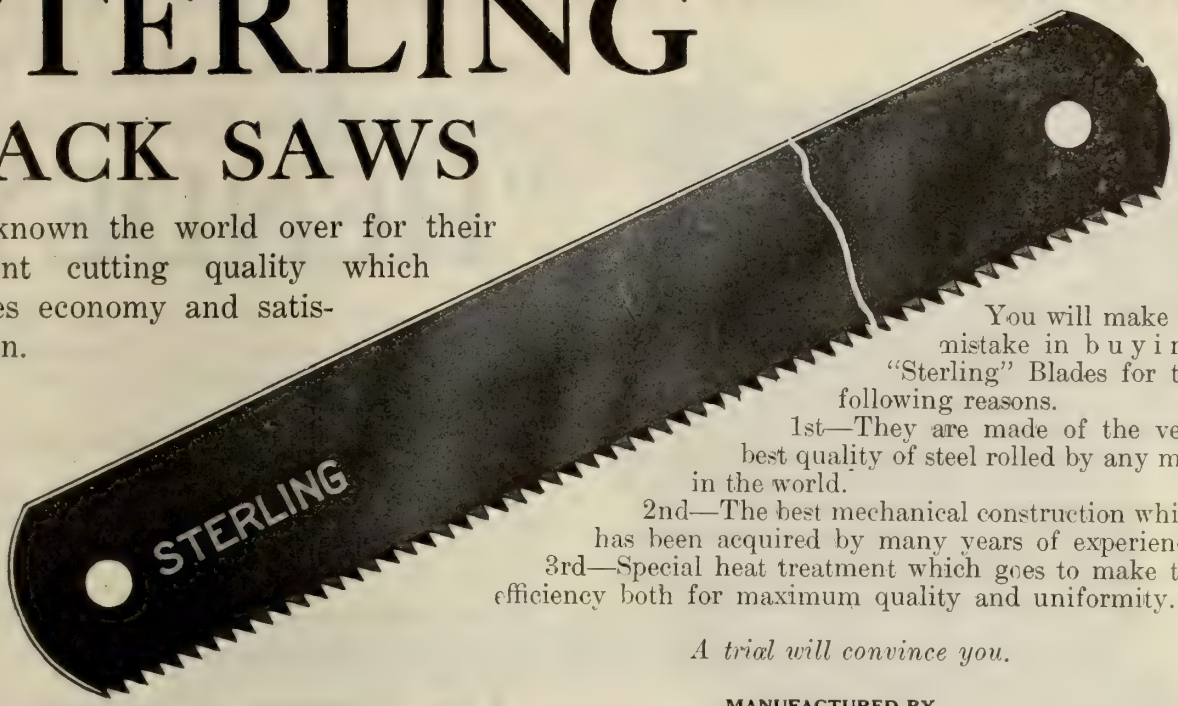
STERLING
HACK SAWS

Are known the world over for their efficient cutting quality which insures economy and satisfaction.



You will make no mistake in buying "Sterling" Blades for the following reasons.

1st—They are made of the very best quality of steel rolled by any mill in the world.

2nd—The best mechanical construction which has been acquired by many years of experience.

3rd—Special heat treatment which goes to make the efficiency both for maximum quality and uniformity.

A trial will convince you.

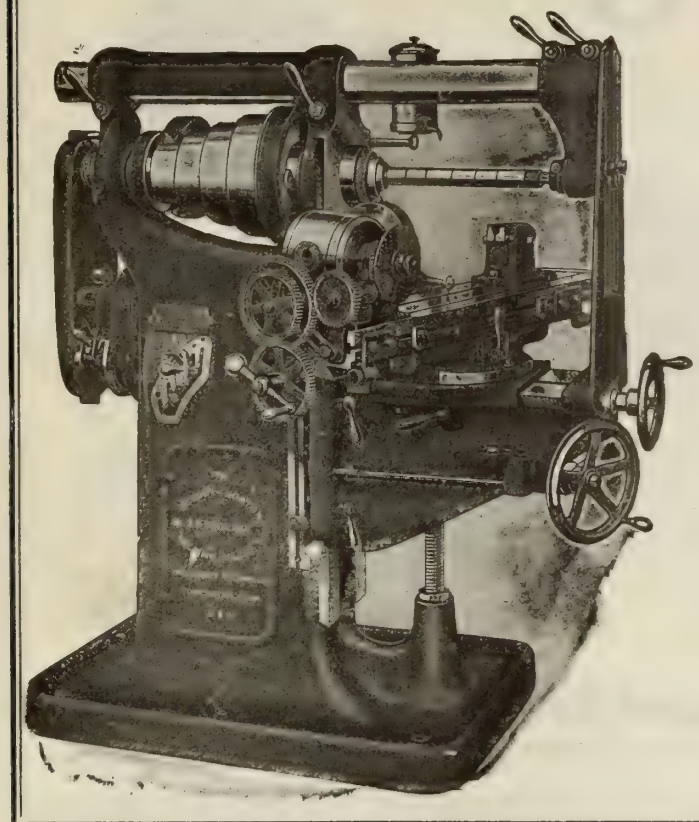
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Tungsten
Hack Saw Blades

These TUNGSTEN HACK SAW BLADES have been in operation in the largest cutting-off plants in Canada, working on all classes of steel, iron pipe, aluminum, brass, copper, etc., and have never yet been known to fail. They master all cutting-off difficulties. Efficiency and economy are the two things that every manufacturer is working for to-day, and TUNGSTEN HACK SAW BLADES, from his standpoint, are the best that can be bought.

In ordering blades be sure to specify just what work they are expected to do so that we can furnish a blade that will exactly suit your requirements.

FLEXIBLE BLADES FOR HAND USE

Gray 22"x22" Spur Geared Planer

Gray Planers are built by a firm that makes nothing but planers. They are given the entire time and attention of a large organization —and their performance shows it.

The parts are so proportioned and the metal so distributed that the planer is quick acting and simple in operation, and yet sufficiently stiff, strong and powerful to perform a great portion of the work for which larger, heavier and more clumsy planers are ordinarily used.

Superior Grinding Wheels

Fast and Cool Cutting, Durable and Uniform. Vitrified Silica or Semi-Vitrified and Elastic Process. "FOSS" Service gives special attention to using the right wheel in the right place. We have a large stock of shapes and qualities on hand for prompt shipment.

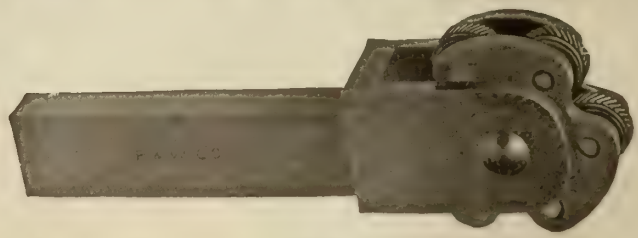
SMALL TOOLS

P. & W. Combination Lathe Knurling Tools



Combines Three Distinct Knurling Tools in One

You will save time by using this three-in-one Lathe Knurling Tool.

It carries three pitches of knurls fine, medium and coarse, as shown in sample. This does away with necessity of having three holders or of changing knurls where but one holder is available. Same knurls can be used in this holder as are used in our regular Lathe Knurling Tool.

FINE MEDIUM COARSE

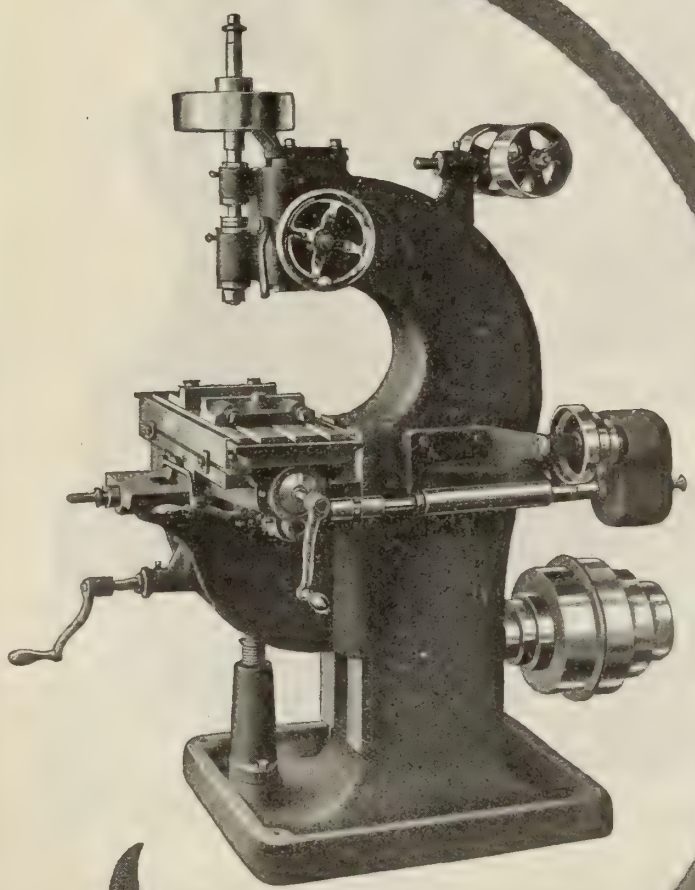
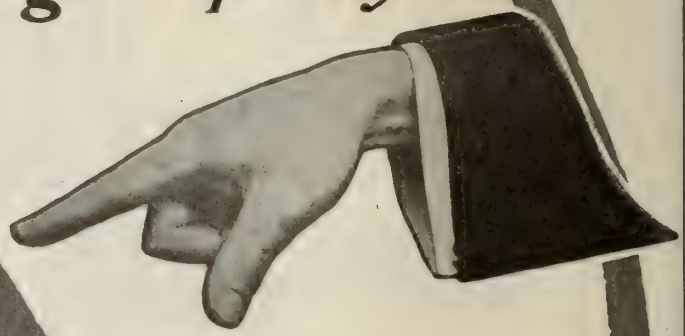
BRISTOL

Bristol Vertical Milling Machine

A Tool of Large Capacity





Ball Bearings are used at the most important points making it a free running tool, which, combined with its being a belt-driven machine, makes it capable of turning out work on which an extra smooth finish is desired.

The longitudinal table feed is controlled by the gear change box which gives six different feeds for each change of spindle speed. A stop to gauge with micrometer adjustment is used on the head to regulate the depth of cuts.

Learn all about its production capacity.

Write for bulletin giving fullest particulars.

LITTLE WORDS WITH BIG MEANING

Quality

According to "Webster," Quality is "an excellence of character; natural superiority."

Service

Webster's definition of "Service" is; "The performance of labor for the benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″ x 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14″ wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material. Motto: **"Quality and Service."**

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6″—5 x 5″—4 x 4″
3½ x 3½″—3 x 3″
2½ x 2½″—2¼ x 2¼″
2 x 2″—1¾ x 1¾″
1½ x 1½″—1¼ x 1¼″

ANGLES—Unequal Leg—
6 x 4″—6 x 3½″—5 x 4″
5 x 3½″—5 x 3″—4½ x 3″
4 x 3½″—4 x 3″—3½ x 3″
3½ x 2½″—3 x 2½″—3 x 2″
2½ x 2″

BEAMS—
15″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

CHANNELS—
15″, 13″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜″
3⅜ x 5⅛ x 3¾ x 7/16″
3 1/16 x 4 x 3 1/16 x ¼″
3⅛ x 4 1/16 x 3⅛ x 5/16″
3 3/16 x 4⅛ x 3 3/16 x ⅜″
2 11/16 x 3 x 2 11/16 x ¼″
2¾ x 3 1/16 x 2¾ x 5/16″

ROUNDS—
All sizes from ½″ up to and including 4″.

SQUARES—
All sizes from ½″ up to and including 3″.

FLATS—
All sizes from 1 x ¼″ up to and including 14″ wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

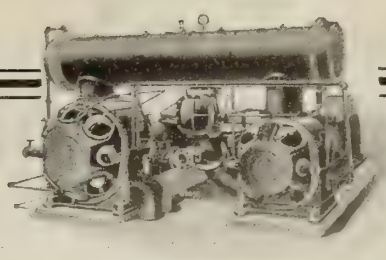
HEAVY BETTS DUTY

BETTS MACHINE CO.

408 BLOSSOM ROAD ROCHESTER, N.Y.



For reconstruction work Canada needs compressed air. For pumping by the air-lift system, for hoists in all classes of work, for pneumatic riveters, chippers, drills, and grinders in structural work and in the shops. For spraying paint, cleaning out electric motors, operating air chucks, etc.

Use compressed air.

Air Compressors

For all these uses of compressed air you must have a reliable source of supply. C-I R-Co air compressors are reliable at all times; for steady, continuous operation they have no superior. They come from a plant that has been manufacturing compressed air machinery for twenty-five years.

Our experience counts.

Engineering Aspects

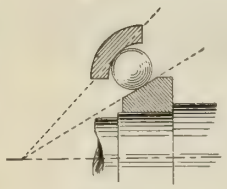

Fig. 1

OF the early history of ball bearings it is necessary to say but little. The fact that a weight could be moved with little effort on balls or rollers was known before the times of Archimedes or the Pyramids, but to find durable rolling members was another matter. As compared with a round bar turning in a wood, bronze, or cast iron sleeve, the high cost of even the simplest anti-friction bearing deterred efforts in that direction till the bicycle came.

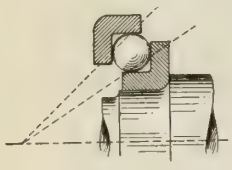

Fig. 2

Of the technical features of early ball bearings, the following were prominent:

1. Adjustability. Intended to avoid costly accuracy in fitting, to facilitate assembling and to compensate for then seemingly inevitable wear.

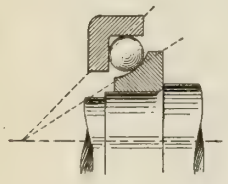

Fig. 3

2. Load Carried, not in the line of contacts, but at an angle thereto. This resulted necessarily from the adjustable feature.

3. Materials. Occasionally tool steel, but more often mild steel, case-hardened.

4. Construction. Accurate according to the standards of the time, but liable to vary one or several thousandths of an inch from true form in both balls and races. No separators used between the balls.

5. Finish. Balls and races ground passably smooth, and left to roll themselves to a true finish if they would.

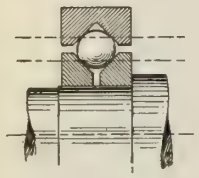

Fig. 4

6. Protection and Lubrication. No special provision made either to exclude dirt or to retain oil.

To the ball bearings expert of to-day these characteristics seem absolutely farcical; yet a dozen years ago no one could have said with authority that they were not as good as any others. Nevertheless, it is easy to-day to point out the defect in each.

MONARCH SERIES CONRAD PATENT

The two cuts shown represent the last word in Radial Ball

No. 1 of a Series of Technical

CANADIAN SKF

Eastern Sales Office:
412 St. James St. West
Montreal, Que.

# of Early Ball Bearings

The rise of the bicycle, and the need for conserving the very limited energy of its human motor, brought forth numerous types of two, three and four point ball bearings, of cup and cone and other types; and for very light service these types did well. Some of them are illustrated in the marginal sketches. All are familiar; all share certain technical features in common; all are to-day distrusted by reason of their failure to endure the heavy loads and high speeds demanded in serious commercial work.

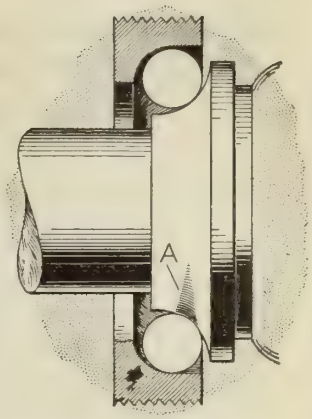

Fig. 5

1. Adjustability. No adjustment which acts alike for worn and unworn portions of a cup or cone, or which shifts the cup or cone at an angle to its line of wear, can compensate correctly. It merely shifts the path of contact, and the then highly localized pressure soon breaks down the new path and makes a bad matter worse. Not even a new bearing should ordinarily be adjustable, for the average user sets it either too loose—which compels one or two balls to take all the load —or too tight, which crushes balls and races.

2. Carrying the Load at an angle to its natural direction augments the pressures sustained by the balls. With a rational design, the line of contacts is as nearly as possible the line of applied pressure.

3. Materials. Unless the ball or race is homogeneous clear through, it will both compress and wear unevenly. Aside from that, the steels of twelve years ago were not good enough for good ball bearings; they were either too soft or too brittle.

4. As the balls and races are but slightly compressible, they will not distribute the load evenly unless formed with extreme accuracy. For balls, one ten-thousandth of an inch is about the limit of permissible variation.

5. Even the highest polish, under the microscope, is a mass of scratches. Only the "high spots" take the load, and if these are not fairly smooth they necessarily wear down. Only a very rough ball wears smoother, however; in general, the end of the first surface is the end of the ball's usefulness.

6. Dirt and Oil. Dirt ruins a ball bearing by grinding away the first polish on which durability largely depends. Oil is necessary, both for minor lubrication and to prevent rust. If dirt is kept out and oil (or grease) is kept in, the lubricant will last for months without being even discolored.

Elementary as these facts seem, it took years of time and a veritable fortune in experimental research to establish them fully, and to point the way to a genuinely durable type of ball bearing. Yet when that was done the results seemed, by comparison with the early failures, almost miraculous.

A WALL RADIAL DRILL

That Puts Dollars in Your Pockets

Here's a real machine tool in the wall radial drilling line for your consideration. Listen to this—the machine is made of high grade materials throughout, and the workmanship is beyond criticism. It is designed with the particular idea of maximum production, at a minimum operating expense. Entire control within easy reach makes the operators "boosters" for these machines. You can keep the dollars that may be slipping away on your wall radial drilling propositions in your pocket by the installation of this machine.

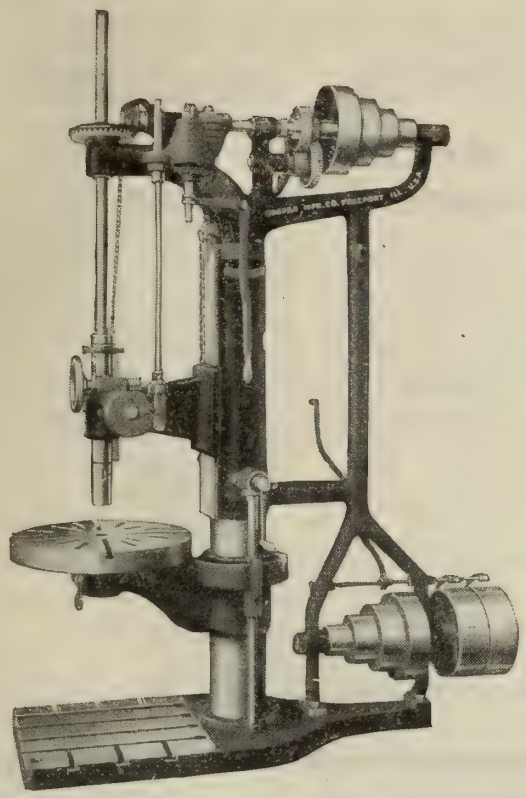
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

HOEFER MFG. CO.
FREEPORT, ILL.

About Construction

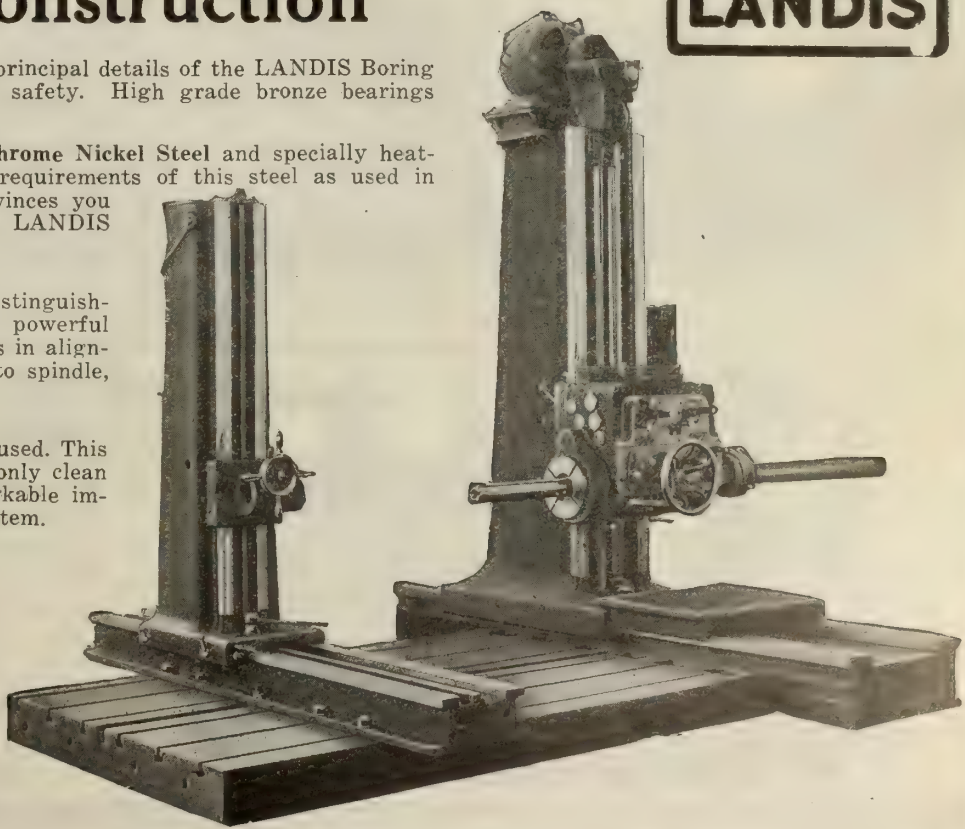
LANDIS

Unusually heavy construction of principal details of the LANDIS Boring Machine increases the factor of safety. High grade bronze bearings insure long life and accuracy.

Gears and shafts are made of **Chrome Nickel Steel** and specially heat-treated The extremely severe requirements of this steel as used in gear shifts for automobiles, convinces you of its efficiency and strength in LANDIS gears.

Our concentric screw-feed is a distinguishing LANDIS feature insuring a powerful yet very sensitive feed—is always in alignment and without side pressure to spindle, found in rack and pinions.

The syphon self-oiling system is used. This method of supplying oil permits only clean oil to enter the bearing, a remarkable improvement over the pumping system.



Write for our Catalog.

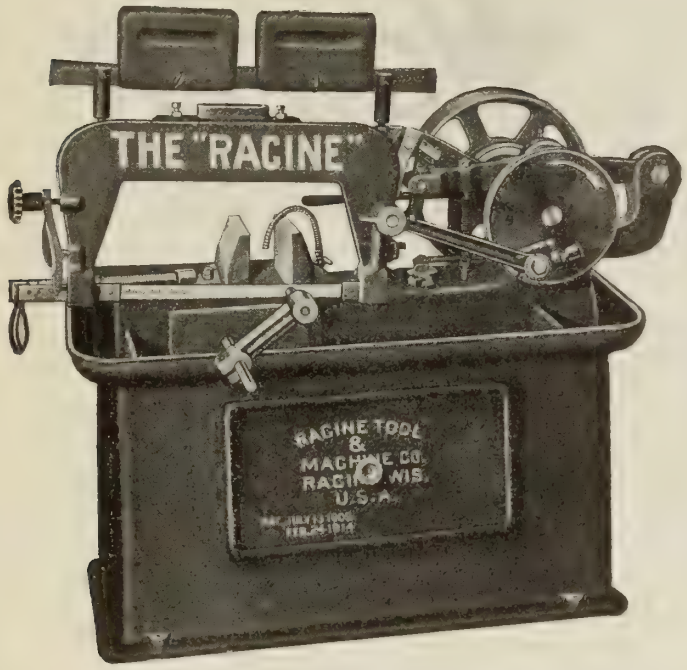
Standard the World Over

"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

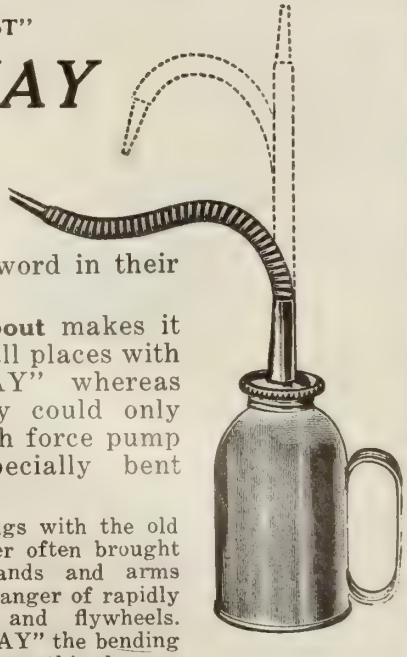
"SAFETY FIRST"

ALL-WAY
RAILROAD
OILERS



are the latest word in their line.

The **flexible spout** makes it possible to oil all places with one "ALL-WAY" whereas previously they could only be reached with force pump cans with specially bent spouts.

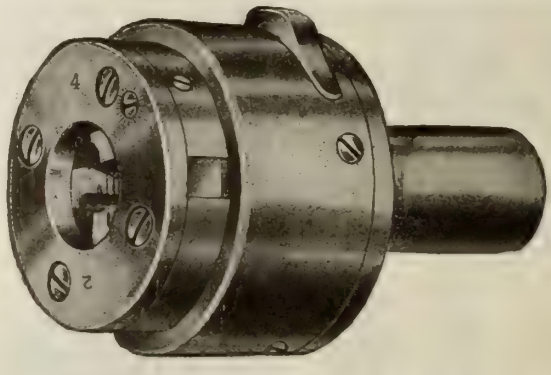
Lubricating bearings with the old straight spout oiler often brought the engineer's hands and arms very close to the danger of rapidly revolving gears and flywheels. With the "ALL-WAY" the bending of the spout removes this danger.

Sizes No. 4, 1 pint—10 in. spout. No. 5, 1 quart—11 in. spout.

Flexible spouts can be furnished for any kind of oiler. If your dealer cannot supply you write us.

We also manufacture the well-known "All-Way" Oil Can—saves you 50% of your oil bill.

THE ALL-WAY OILER MFG. COMPANY
196 KING STREET WEST - TORONTO, ONTARIO



H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Here's Pinion Shaft Grinding On a Norton

This photograph was made in one of the well-known automobile factories, and shows just how Pinion Shafts for a well-known truck are being produced. In the rough these shafts have a diameter of about 1¼ in.; from .018 in. to .020 in. of stock is removed, the operator being allowed a tolerance of .0015 in. and the output is approximately 200 daily. The machine shown here has been in constant use over 8 years, has required hardly any repairs, and has always given splendid satisfaction.

This is fairly good grinding, but no better than you should obtain. Compare your results and if you are in need of additional information, write to us. We'll be glad to help you.

Using Edging Rolls in Breakdown Emergency

Mill Managers as a Rule Aim to Keep Their Production Up to a Maximum. Herein is Described the Use of Edging Rolls as a Help to Quick Shipments

By W. S. STANDIFORD

IN these days of efficiency methods there is nothing more annoying to mill managers than to have a roll break during the rolling of an order for iron or steel bars, which are so essential to the construction of various machines, when a contract between the manufacturer and consumer requires delivery of the bars to the latter at a specified time. The usual method of procedure adopted by mill managers is to order another roll cast at a foundry, and when it arrives, work their roll turners night and day until it is finished, the rolling of the bars being then resumed. The employment of edging rolls in quickly filling orders when breakdowns occur seems to be little known t mill managers, yet the us of such rolls allows of fill ing the order very prompt ly and on time, the onl delay being caused by th roller in the time taken i changing the rolls, whic is very small.

As it is the aim of ever mill manager to keep hi deliveries of bars up t their maximum output, th use of edging rolls to enable quick shipments to be made, not only benefits the rolling mill owners, but passes it along to machine shops and others in different lines who use enormous quantities of iron and steel bars. These rolls are also a very valuable asset to any mill doing jobbing work, to fill orders for bars in large or small quantities, in widths of which there is only a small demand and for which it would not pay to turn a new set of rolls to make the sizes desired. As an example: Suppose that a mill had an order for flat bars of iron 2 1-32 of an inch wide by ⅜ of an inch thick, and had no rolls to make them in. The roller would simply put in the housing rolls that contained a 2⅛ inch pass for making bar iron or steel, also the edging rolls and a set of planishing rolls or "bull heads" as they are termed in rolling mill vernacular. The method of procedure adopted by the roller, is, to first make an iron bar in his flat rolls 2½ inches wide by 7-13 of an inch thick, which is 1-16 of an inch thicker than the desired thickness of the finished bar. Some rollers make the bar ⅛ of an inch thicker so as to fill the edging pass out more.

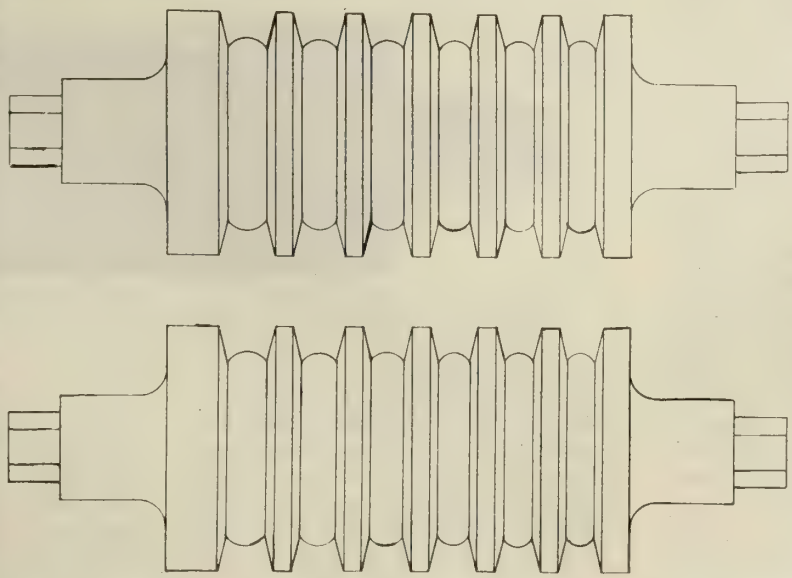

FIG. 1—SHOWS A SET OF EDGING ROLLS FOR EDGING SMALL FLAT BARS ON A GUIDE MILL. THE USE OF THESE ROLLS ENABLES ORDERS FOR IRON AND STEEL BARS TO BE DELIVERED PROMPTLY.

Either system of handling the rolls will make good bars, the advantage being with the 7-16 of an inch one as it does not wear out the edging roll grooves or the surfaces of the planishers too quickly. As the red hot bar comes from the finishing pass in the flat rolls, it is inserted edgewise into the 7-16 inch pass in the edging rolls, the latter having been set so that the distance between the deepest corners in the pass will measure —allowing for shrinkage of the bar when cold—2 1-16 inches. In some cases there will have to be some slight variations made from these sizes, owing to the temperature at which the metal is rolled, speed of the rolls, quality of the metal in the bars made, in most cases they being made out of scrap iron which nowadays contains anything from Norway iron to tool steel. From the edging rolls, the bar next goes to the planishers, which have been set a few thousandths of an inch over ⅜ of an inch.

All of the above conditions have a direct influence on the size of the bar when cold. The best method of using edging rolls is to set them at the estimated height, allowing for the bars' shrinkage when cold, and then run a short hot "trial bar" through them. It can then be seen whether the rolls have to be raised or lowered slightly by means of the housings screws. At any rate, the variation from the sizes given will only amount to a few thousandths of an inch in the raising or lowering of the rolls.

Another use in which edging rolls can be used to advantage is as follows: It is well-known fact among rolling mill managers and superintendents that rolls for making flat bars generally wear out wider at the sides long before the passes by wear and turning of the rolls get so small that they have to be discarded as useless and new ones turned. When this class of rolls are worn so that the passes are 1-16 of an inch wider at the sides and enlarges, so that they make

a fin on the bar at the joints between the tongue roll in a two-high set, these rolls, although making a bar wider than the desired size, can, by the aid of the edgers and planishers, make perfect bars to the exact size desired and thus save money for any company.

It will readily be seen the important part these rolls play in saving money for rolling mill owners, they being of especial value in these days of efficiency in production. Having placed before the readers of this magazine the practical advantages accruing through the use of these rolls, I will now take up the constructional details of edging rolls. The rolls depicted in Fig. 1 are a set for edging small flat bars on a guide mill, and they contain the following passes: ¼, 5-16, ⅜, 7-16, 9-16, and 11-16 inch wide grooves, it being remembered that 1-16 of an inch is allowed for straightening of the sides and planishing to the required thickness of the bars, which for the above passes as 3-16, ¼, 5-16, ⅜, ½ and ⅝ of an inch. The width of the bars made is controlled by the amount of up and down space that the housing screws allow, and also the diameters of the rolls. In regard to the diameters and lengths of the rolls, there seems to be no standard lengths, each mill owner having his own ideas in regard to it.

The rolls in this set are 20 inches long (not including necks and wobblers) and 10 inches in diameter. Some rolls have duplicate passes of the various sizes in order to make the rolls last longer without dressing. Others contain the usual number of grooves and have a blank space for the insertion of other sizes of passes. In some cases the blank space is used for planishing purposes. But the latter is not an economical one for the reason that the planishing surfaces get roughened by use long before the edging passes need dressing in the lathe. It is essential in roll dressing to take the same amount of metal off of all passes so as to keep their proportions the same as when they were first turned. By this it is not meant that the rolls should be the same in diameter as when they were first made—as by wear and turning they are continually getting smaller. What is meant is, that the diameters in the bottom of each pass have the same proportionate depth to the diameters of the collars or barrel of the rolls when they were new. In dressing rolls, if 1-32 of an inch were taken off of the surface and passes of the top roll, the same amount should be removed from the bottom one—or if the rolls are three high, from all of them. The top roll of the edging set (which are most always two-high) should be ⅛ of an inch larger in diameter than the bottom one, the faster peripheral speed of the top roll then throws the bar down and away from the pass, delivering it straight, thus destroying the tendency of the bar to fly upwards, pass over the top of the top roll and meet the other part of the oncoming bar, which, in the case of iron being made, becomes welded to it. This is technically called "a collar," and it forms one of the most exasperating and costly delays which a mill can have, frequently the sudden stop resulting in the engine breaking down or the journals of the wobblers of the rolls being twisted off.

On the other hand, should a top roll be 1 inch larger in diameter than the bottom one, a "backlash" will result owing to the peripheral speed of the surface of the top roll being much greater than that of the bottom one. This results in flat bars having a corrugated shape, they also being uneven in gauge. Backlash is also very hard on the rolls and machinery, it frequently causing damage. In all cases, especially in the designing of rolls for making thin shapes and sections such as angles having an unequal length of side, the position of the pass has to be carefully placed in the rolls if bars without bent and torn edges are to be secured. Rolls for making large round bars do not require the top roll to be larger than the bottom one, the force of gravity ensuring that the bar delivers in a straight line. By referring to the edging roll photograph depicted in Fig. 1, it will be noticed that the bottoms of the passes are rounded. This is done so that the finished bar will have straight sides, as otherwise the bull heads bulge the centre portions of the sides out. By having the narrow sides of each bar concave as they leave the edging groove they straighten up nicely in going through the planishers. In order to make the photograph show the convexity of the bottom of the edging passes clearly, the curves are shown purposely exaggerated, as in actual practice, for the sizes of the grooves under discussion, they would be nearly straight; a roundness of only eight 1-1,000ths of an inch being required between the corners and the highest part in the centre of each pass. In designing edging grooves for making flat bars of iron or steel of one inch and over in thickness it is the usual practice to allow more convexity of surface in each different size of groove.

The collars of the passes of the small edging rolls shown in the illustration have a taper of 6 degrees and a depth of ⅜ of an inch, all being equal in depth. Many roll designers and roll turners will disapprove of having all of the edging grooves of a uniform depth; the usual practice in this respect being to make the smaller ones such as the ¼ inch passes shallower than the ⅝ of an inch and smaller ones. From an efficiency standpoint, the writer as a practical roll designer has found out by experience, that it pays to make them all of equal depth, as the roller can work with greater speed and efficiency. An example to illustrate this point will be given. Suppose that a roller has to make flat iron bars 1¼ inches wide by ¼ of an inch thick, and that rolls containing a 1⅜ inch wide pass are to be used to make the 1¼ inch bars. It frequently happens that the roller during his day's work has orders calling for bars of the same width, but varying in thickness. Now, by turning all of the passes to the same depth the roller has only to set his rolls for the one pass, and the other ones will have the same widths if the roll turning has been accurately done. The roller will thus be enabled to get the work out far more quickly than if he has to stop and lower or raise his rolls, using trial bars in each case to get his sizes for bars having the same width, but differing in thickness.

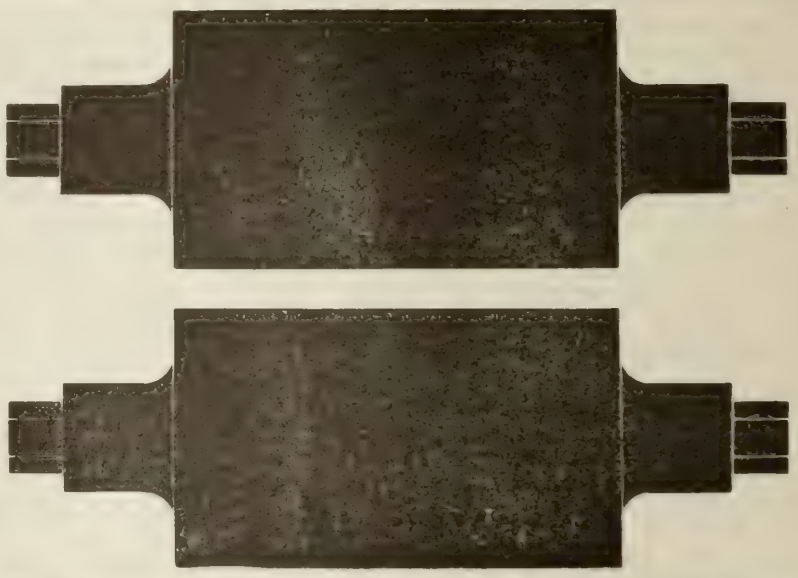

FIG. 2--DEPICTS THE PLANISHING ROLLS FOR STRAIGHTENING THE SIDES OF THE BARS AND ALSO FOR SMOOTHING THE TOP SURFACES. THE USE OF BOTH SETS OF ROLLS SAVES MONEY FOR MILL OWNERS.

It is the practice of up-to-date mill managers to so group their orders that the roller, when working on different thicknesses of bars, will have no more changing of rolls than is absolutely necessary, as the time consumed in changing and adjusting the rolls to make various widths of iron or steel bars delays production and costs money. The planishers or bull heads shown in Fig. 2 are generally made out of chilled cast iron as this metal has long-wearing qualities. Whenever possible it is best to have a set of bull heads having as long a body length as can be gotten into the housings, sets of rolls with lengths of 18 or 20 inches, lasting long before needing dressing in the lathe. In using these rolls, when one portion gets rough

the roller shifts over to a smooth part, hence the advisability of using rolls having a long body length, as it will be quite a while before they require dressing.

The use of chilled iron for planishing rolls has one drawback as contrasted with those made out of ordinary hard cast iron, and that is, whenever a jam occurs with a bar in chilled iron rolls, the metal is compressed, forming what is technically termed a "burnt spot," which vary in depth from 1-32 to ⅛ of an inch. Turning out a burnt spot is one of the most exasperating and tedious pieces of work that a roll turner has to contend with. This is due to the fact that chilled cast iron is very nearly as hard as the tool used to turn it, and when the metal is compressed it is rendered as hard as the metal in the tool. The result being that when the tool touches the burnt spot it slides over it, the edge of the tool breaking out at the same time, thus necessitating regrinding. The method adopted by the roll turner in turning out burnt spots is to resharpen the tool and take a light cut until he nears the hard spot, then he takes a very heavy cut so as to get under it and lift it out. The tool is then reground and the process repeated until it is turned out. The surface of the roll is then trued up with another tool. The roll turner, in doing this work, actually spends more time grinding the tool than is spent in the turning as the burnt spot shatters the edge each time it is used. It is hardly necessary to state that the workman does not stand in front of the lathe while cutting or breaking out these spots, as pieces of the spot and tool fly out with considerable force.

In handling of the edging and planishing rolls, the roller has to use judgment, if one set of rolls are smooth and the other is rough. Thus, if the finishing flat roll passes are smooth and the edgers and planishers are rough, the finished bars will have a rough appearance. If the finishing flat roll passes are rough before the bars go into the edgers and planishers, the edging and planishing rolls being smooth, then the finished bar will be smooth. Should both the flat rolls and the planishers be smooth, while the edging rolls grooves are rough, then the finished bars would have smooth tops and bottoms and rough sides, as the edging rolls control this part of the bars. The foregoing shows that the roller continually has to use judgment in handling the rolls, as he can spoil the appearance of the best metal ever made by not attending to details.

Will Wait a While.—The threatened strike of railway shopmen in the United States has been held over for a time, according to a decision reached by the executive council of the American Federation of Labor. The wage increase offered by President Wilson was declared inadequate by a vote of 325,000 to 25,000, but the men agreed to leave action to the International officers. The executive decided not to put the vote in operation till the result of the Government's efforts to decrease the cost of living becomes apparent.

COST OF CUTTING TOOLS

From Machine Tool Review

IT is remarkable that any false ideas should prevail as to multiple tool machines being disadvantageous on the ground that cost of cutting tools used on them is higher than those used on single operation machine tools. This idea is not widely entertained, but is persistently revived, sometimes by capable men, who perhaps have not had time to reason it out thoroughly. The idea crops out in arguments in which comparisons are made between two classes of machines. In the course of these disputes items of cost, such as capital, tools, floor space, etc., are isolated for comparison as involved in the two methods. If the summing up of the totals of the items is neglected no useful conclusion can be reached. There is no sin or virtue, or profit or loss, in using more or less cost in one of these items. The point is which is the least costly method of doing a given quantity of work. Even on these broad lines it should first be considered whether the work really is equally good by either method. In fact, possible cost is not the sole consideration, although it is so important.

Assuming, however, that the two methods are equal in all things except cost of production, it is necessary to analyze cost under classified headings. We must expect, then, that as the methods are different the cost headings will differ and cannot be compared in classes one against the other. It is only the totals that tell. For example, in cutting tools. If old plant is used carbon steel tools may do as well as high speed steel in cases where the cheaper steel will cut as much as the machine will drive. But that will not be a general rule. In cases where it is true the tools will be less expensive but the cutting will be more expensive. If we leave out cost of steel and its relation to quantity of cutting, and consider only the time spent in sharpening to keep the tool fit for its work, it will not matter which type of machine it is on. If one tool is continuously cutting on a centre lathe as against, say, six tools on a multiple machine, then we may be asked to assume that each tool on the multiple machine cuts on an average only one-sixth part of the working day. That will not affect its "wear and tear" expense in the end. If other conditions are equal the tool on a single operation machine will be sharpened six times as often as on the multiple machine, but that is solely because we assume it to do six times as much work per day. If we allow that asumption, which we would not on its merits, it only means that by using single tool machines there will be less capital fixed in tool steel. If we consider capital, in comparing two methods of production, we must consider the total capital required to produce a given output and in relation to the wages cost of the output. These are old arguments, but still often misunderstood. In splitting up items of cost for separate comparison we may evade any real problem there is if we neglect to assemble the detail losses and gains, compare the totals, and show on which side the balance of advantage lies. The single machine method might be taunted with using six times the quantity of belts, countershafts, floor space, etc. Those would all be equally, or unequally, relevant, but no one of them would solve the problem.

It may be said generally that the multiple machine method leads to increased expenditure on cutting tools. A better stock of tools is kept, better skill and attention is given to dressing them, and concurrently with the increase of knowledge obtained finer and more costly tool materials are preferred. But all this results in lowering the total cost of production. If a six-tool machine is standing idle because one tool has failed the effect is to make a bad manager despair while a good manager applies his talents to overcoming the difficulty. The competent man it not going to give up good machines because he has bad tools. The fact, however, behind all this is that even where multiple machines are not used it would pay to give far better attention to and spend more money on the cutting tools.

DRIVING CHAIN MANUFACTURE

The leading British manufacturers of driving chains have resolved to form a permanent association of their interests in order to develop the trade on lines that will fully satisfy home requirements and enable them to compete abroad. The associated firms are the Alfred Appleby Chain Co., Ltd., Birmingham; Brampton Bros., Ltd., Birmingham; the Coventry Chain Co., Ltd., Coventry, and Hans Renold, Ltd., Manchester. These firms will work together in improving the quality of driving chains and gear, in promptly meeting the demands for quantities and in supplying technical and other information. They will also be able, by co-operation, to bring more efficient service to bear in securing to this country a proper share of foreign trade. Some of the immediate work in hand is: (1) To standardize chains, wheels, and chain wheel cutters; (2) To simplify matters by eliminating any redundant sizes which create expense and difficulty to the user without serving any useful purpose; (3) To provide for a large and rapid output so that new schemes can be carried out with the least delay; and (4) To systematize and develop technical knowledge both for manufacturing purposes and for use in applying chain drives. It is not many years since the conveyor chain and the bicycle chain were the only driving chains very widely used. With the development of exact manufacture much wider applications were tried, and the new difficulties which arose were dealt with in a way that created a separate and flourishing branch of manufacturing engineering. The association aims at retaining the position and extending it.

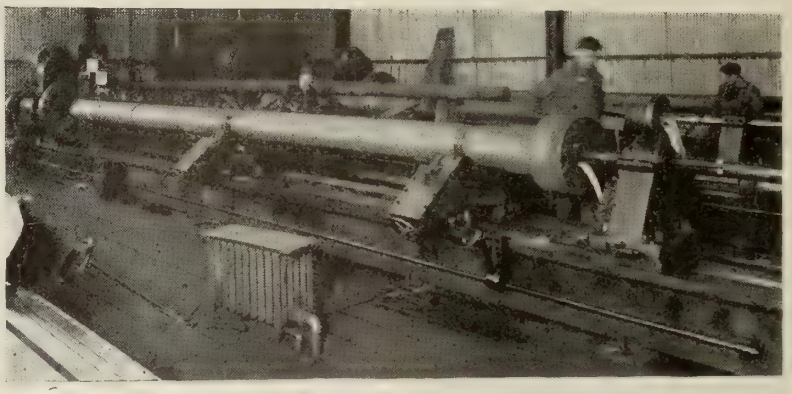
Goodyear Building at Regina. — A three-storey building will be erected by the McKay Construction Company, contractors, for the Goodyear Tire Co. The building will be used as offices and warehouses, and is estimated to cost $75,000.

Various Operations On Propeller Shafts

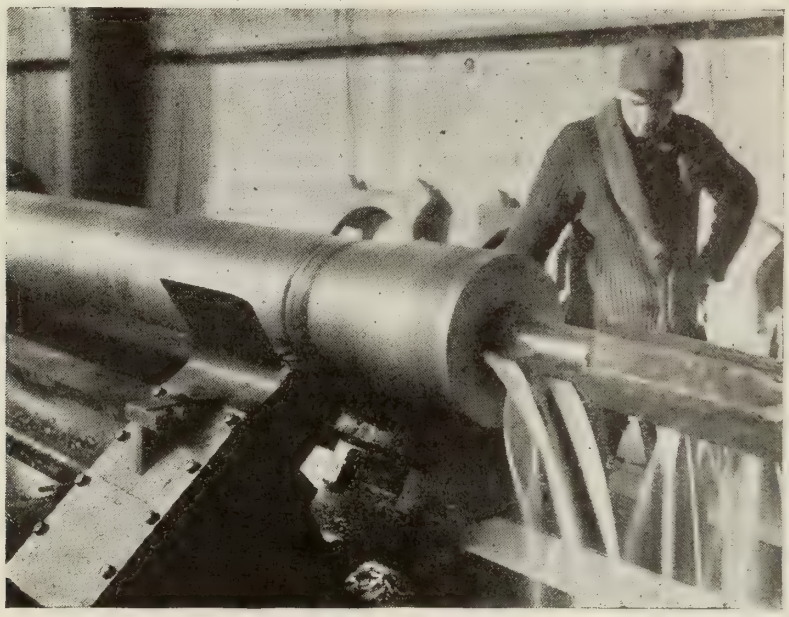
These Views Illustrate Interesting Work on Marine Shafts, Bored Out, Etc., on Special Large Hollow Boring Lathes. These Pictures Were Taken at the Plant of the Pollak Steel Company

By FRANK C. PERKINS

THE accompanying illustrations show the Pollak Steel Plant equipment at Cincinnati, Ohio, where steel axles and forgings are provided for locomotive and marine service. The equipment of the hammer shop for forging locomotive side rods and other parts is equipped with modern hammers, and in the press shop may be found several one thousand ton steam hydraulic presses with a battery of furnaces in the background. These presses are served by two overhead travelling cranes with special electrical turning devices. The large marine propeller shafts from the press are forged and delivered to the machine shop to be hollow bored and rough turned. The 72 ft. hollow boring lathe bores a large hole through the solid of a marine propeller shaft.



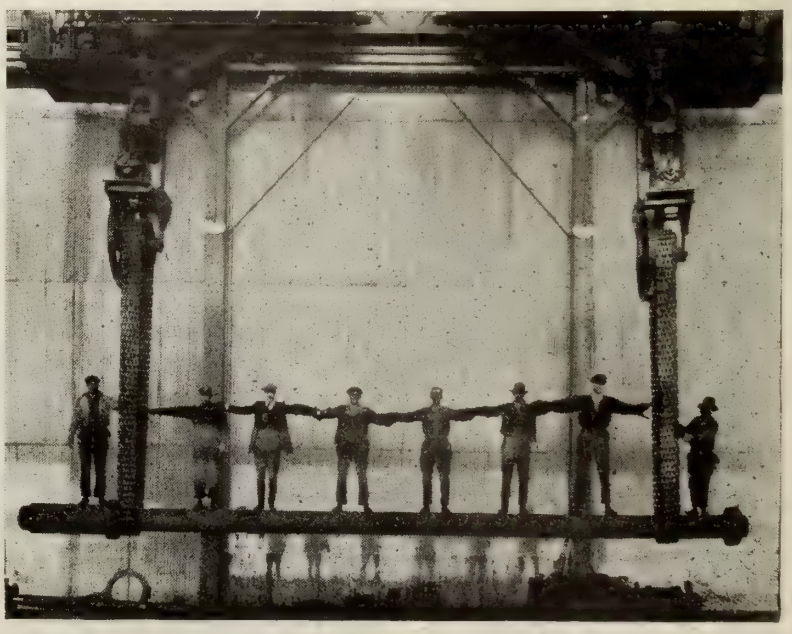
BATTERY OF LARGE HOLLOW BORING LATHES AT WORK, BORING LONG MARINE SHAFTS.



72" HOLLOW BORING LATHE BORING HOLE THROUGH SOLID MARINE PROPELLER SHAFT.

In the heat treating department there is a battery of vertical furnaces with large quenching tank to the right. To the right there is a battery of large car type annealing furnaces. All these furnaces are equipped with electrical devices for determining the heat temperatures, which is very important in the heat treating of steel. All the furnaces are controlled from a central station, which makes it possible to have uniform heat throughout. The large shaft is lowered into the furnace to be heated and then quenched in the quenching tank to the right. One of the most modern cooling systems is operated in connection with the oil quenching tanks. To obtain the highest efficiency in heat treating of steel the quenching fluid should be kept at a constant temperature. The quenching fluid is, therefore, circulated through a series of coils located under water in a 150,000 gallon reservoir. This department is equipped with cranes and conveyors, and is capable of taking care of forgings of every description of from one to one hundred thousand pounds. The marine propeller shafts of great length are bored in a battery of large hollow boring lathes.

The work of the Pollak Steel Company dates back to the year 1865. The fifty-four years of practical experience together with constant application and concentration has done much toward the betterment of forged products of all kinds, such as steam and electric car and locomotive axles. In this plant are produced hollow bored special heat treated locomotive axles, as well as crank pins, connecting rods, cam shafts and side rods, also all kinds of forgings for railroads, marine forgings of every shape and description, forgings for every line of industry, sugar mills, machine tool builders, automobiles, tractors and machinery builders. The plant is equipped to handle anything in the forging line from one to one hundred thousand pounds.



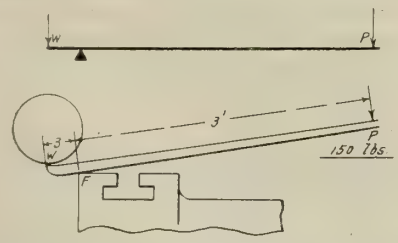
FINISHED MARINE PROPELLER SHAFT AND CRANE SERVICE AT POLLAK STEEL PLANT, CINCINNATI, OHIO.

Shop Arithmetic, Levers in Shop Practice

Eleventh of a Series in Practical Mathematics For the Mechanic and Those Learning the Machinist Trade—Leverage as Applied to Every-Day Shop Practice Forms the Present Lesson

By J. H. RODGERS

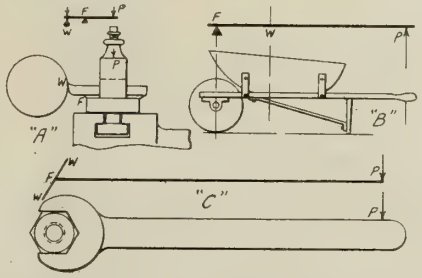
IN our last lesson the instruction dealt with a few practical applications of the simple lever. We will now consider, further, this subject of leverage as applied to every-day shop practice. A very common sight that one might see in the average machine shop is the use of a "tommy" bar for straightening shafting in the lathe. When a shaft is found out of true it is frequently the custom to use the bar and peen, and remove the kink while the shaft is held between the lathe centres—not the best practice we will admit, but if proper attention is given to details, light shafting may be effectively straightened by this method. Probably the way generally adopted is shown in the sketch below, where the shaft is revolved on the centres and the high side determined by the use of chalk. The lathe is stopped, turned by hand until the high spot is at the bottom, or point A, so that the point of the bar will be on the chalk mark, the heel B (fulcrum) resting on the edge of a tool or on the corner of the tool-post rest. The various factors can then be determined as shown in the skeleton sketch.



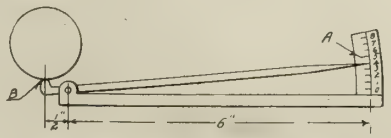
With a lever, as shown above, the resistance (weight) due to bending the shaft would be equal to the force applied at P (150 lbs.) multiplied by the length of the power arm (3 feet), divided by the length of the weight arm (3 inches), or:

$$\text{Resistance } W = \frac{150 \times 3 \times 12}{3} = 1800 \text{ lbs}$$

A few practical illustrations of the simple lever are here given; "A" shows a lathe tool in position, and emphasizes the importance of minimum overhang, to insure rigidity and prevent chatter. This rule holds good wherever cutting tools are used. "B" shows a loaded wheelbarrow and demonstrates the advantages of concentrating the load as near the wheel as conditions will permit. The weight, however, should be so placed that the power applied on the machine will be a lifting one, as better control is possible. "C" shows the lever when tightening a nut with a spanner. The solution in each case is calculated on the supposition that the force is applied in a perpendicular direction to that of the lever. In using a wrench, however, this condition will not always exist, but greatest efficiency is obtained when such is the case. When using a wrench on a nut it will be seen that the sides bear on the corners of the nut so that the resistance or weight arm will equal the radius of a circle, having the corner distance as the diameter.

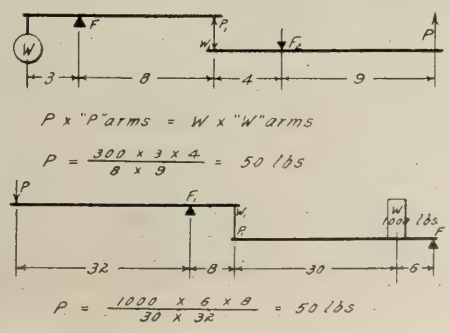


A little study and observation will enable anyone to analyze and simplify almost any mechanical application of the simple lever. The principle is not confined to the equalization of forces as levers are often used to obtain an increased or decreased motion of travel. An example of this kind is shown in the indicator below, the pointer showing a relative movement to that of the contact point, the value of such movement being determined by the corresponding lengths of the lever arms. Suppose that the graduations on the arc A of the indicator are divisions of 1-10 of an inch, and the variation between high and low, when testing a shaft, is found to be 3-10 of an inch; what is the eccentricity of the shaft or the movement of the contact point B, the lever lengths being as shown?

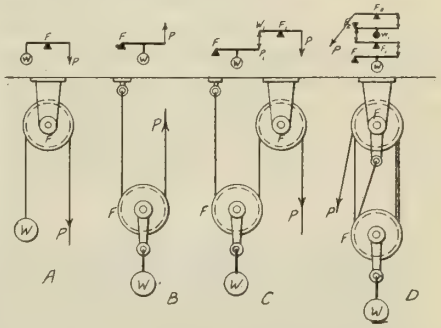


The eccentricity would then be .025, and to bring the shaft or disc central it would require to be moved .025 divided by 2, or .0125 of an inch.

It is not always possible, however, to obtain the results desired by the use of a simple lever, and very frequently it is necessary to combine two or more simple levers into what is termed a compound lever; the principle, nevertheless, remains unaltered. A skeleton drawing of two compound levers is here shown.

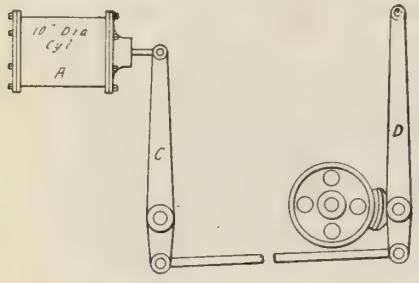


Apart from the levers generally used in weighing scales, the simple application as shown above will seldom be seen in practice. In almost every nook and corner of a machine shop a modified form of the lever may be found. Everyone is more or less familiar with the ordinary pulley, and it is here that we see the most common transformation of the lever, the action being continuous. While this may be rightly placed in the section devoted to pulleys, and will be treated more fully under such heading, a few illustrations will be given here so as to make clear to the student, the direct relation that the pulley or gear bears to the common lever. Below are shown several sketches of block and tackle, together with the skeleton lever upon which the pulley action is based.

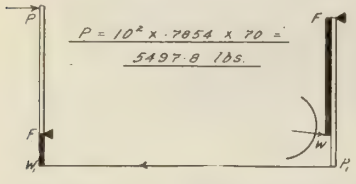


At A we see a single fixed block and pulley, over which the rope passes, the power, P, suspending the weight, W. It will immediately be seen that the force applied must equal the weight supported, as the lever arm in each case is exactly the same length, being the radius of the pulley. At B is shown another style of single block, but with a movable pulley; in this instance the power arm is equal to the diameter of the pulley, while the weight arm equals the radius, therefore, the weight lifted would be twice that of the power applied. A practical application of this particular style of block, however, is not often met with, and to make it more suitable for ordinary work, a modification like that shown at C is adopted, where a combination of a fixed and movable gives the result shown at B, but with the pull at F exerted in a downward direction. This, and the sketch at D, illustrates quite clearly the different factors of the compound lever. The mechanical advantage of the multiple block and tackle is exemplified in the skeleton sketch of the leverage at B. It will be noted that the only advantage derived by the fixed pulley is to

change the direction of the pull and facilitates the continuous movement of the cable in raising or lowering the weight. The skeleton sketch shows the fulcrum of the fixed pulley in the centre of the lever, while the fulcrum of the movable pulley is located at the extreme end, showing a combined application of the first and second class levers. It will be noted that the link connecting the second and third lever is suspended from the fulcrum F^2, but it must be understood that this fulcrum is on the movable pulley and, therefore, the upward movement represents the power at this point. The same condition applies at the fulcrum F_1. These examples have been given to show the relationship of the lever to the pulley. Practical problems will be given under the section devoted to wheels and pulleys.



In the above sketch of an airbrake mechanism, what pressure would be exerted at the brakeshoes B, if the air enters the cylinder A, at a pressure of 70 lbs. per sq. in.? To show more clearly the various factors entering into the solution the skeleton sketch below is given, the power arms represented by double lines, and the weight arms by heavy black lines.



The pressure exerted against the upper end of the brake lever C, is equal to the area of the piston, in sq. in., times the initial air pressure, or:

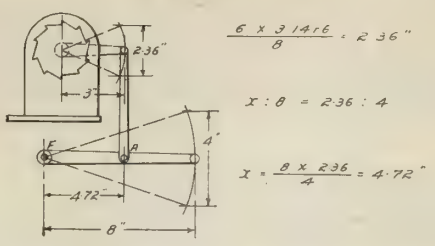
$$x = \frac{5497.8 \times 28 \times 26}{6 \times 20} = 33351 \text{ lbs.} = 16.6 \text{ tons.}$$

It has been shown in a former lesson that the force applied multiplied by the force arms, will equal the weight multiplied by the weight arms. Therefore, the pressure exerted by the brakeshoe against the wheel will be:

$$10^2 \times .7854 \times 70 = 5497.8 \text{ lbs}$$

In fitting a counter to a punch press, that has a stroke of 4 inches, it is found necessary to use an auxiliary lever to reduce the movement. This additional lever was 8 inches long, and it was desired to find the point of connection A, so as to give the proper travel to the lever on the counter.

With a 10-tooth ratchet on the counter it is necessary to have a movement



so that the pawl will just take one tooth at each stroke of the press. To provide a little over-travel and yet not enough to take two teeth, a movement of ⅛ of a revolution was deemed ample for the purpose. The travel of the outer end of the primary lever would then be approximately ⅛ of the circumference of a 6 inch circle, or 2.36 inches. The point A can then be found by proportion, and as shown above would be 4.72 inches from the fulcrum F, of the auxiliary lever.

AN ECONOMIC WAY TO HANDLE SHIPMENTS OF LONG IRON RODS

IN an installation of a Shaw Electric crane at the plant of Bayonne Bolt & Nut Co., of Bayonne, N.J., there is an important illustration of the manner in which one problem of handling material was solved by the application of a few small strands of wire.

This company receive quantities of bar stock-iron rods about twenty feet in length, and ranging in diameter from ¼ in. upward. This raw material comes in gondola cars on the company's private switches.

The unloading and stacking of the rods by hand was, however, a slow process. The rods had to be lifted, one at a time, from the cars and carried to various parts of the yard. From the flexible and yielding nature of the material the placing of a shipment was necessarily slow, and of course, expensive.

In seeking a better way to do the work an electric crane and magnet naturally suggested themselves, but the nature of the material to be handled again interposed an obstacle. With the rods lying loosely in the bottom of the car a hoisting magnet could not pick up a clean load. Some rods would hang and swing. To obviate this, the expedient of having the consigners wire the rods together in bundles of approximately a dozen, the size varying with the diameter, was adopted. With the rods in bundles the profitable use of an electric crane and a magnet became feasible and the apparatus was installed by the Shaw Electric Crane Company of New York.

With the bar stock in bundles the magnet makes a clean lift, not merely of one bundle, but of bundles up to its lifting capacity.

They are raised out of the car and piled practically at one operation. With the crane and magnet the company can now accomplish in a few minutes, work which under the old method took a gang of freight handlers hours to do. There is, besides the saving in labor, a gain in the speed of handling raw material.

Furthermore, the use of the crane permits the piling of rods to a greater height than would have been economically possible by hand work.

HOPE TO "WEIGH LIGHT"

Prof. W. W. Campbell of the Lick Observatory explains the problem of "weighing light" in his "Solar Eclipse Notes" in the Publications of the Astronomical Society of the Pacific, issued at San Francisco. Two British expeditions and at least one American expedition that went out to observe the total eclipse of the sun on May 29, expected to make their main business that of getting data to help solve the problem of weighing light. Prof. Campbell says:

"According to certain hypotheses, light radiations possess mass and are subject to gravitational disturbance. If the hypotheses in one form or another represent the truth, then rays of light proceeding from stars which are seen very nearly in the direction of the sun should be deflected from their straight-line courses, as these rays pass close to the sun and through the sun's gravitational field.

"If a ray of light coming from a star to the eclipse observer just grazes the edge of the sun but without touching the sun, it should be bent from its course in amount 0".87, according to one hypothesis, in twice this amount on another hypothesis, or not at all on a still different hypothesis. The eclipse of May 29 found the sun very favorably situated for the solution of this problem in the northern part of the Hyades cluster. A good number of stars in the photographic field, with the eclipsed sun in the centre, may be rectified with an exposure of ten seconds or less. Many eclipses will come and go before another will be so favorable in this regard."

At this writing we have no news from either the American or the British expeditions. Much other interesting scientific data may be expected when results of the eclipse observations are made known.

Government Labor Statistics.—The Alberta coal mines are calling for about 1,100 men. Returned soldiers are being asked for, and as there are many of these now in the West, incidental to the harvest, it is hoped that they will be available after the harvest for the mines. During August the Saskatchewan Labor Bureau placed 8,536 men out of 8,761 applying for work. There were out of this number, 1,264 Saskatchewan farmers who have suffered crop failure, the balance being mostly harvesters from Eastern Canada.

Harvesters for Railway Building.—The extensive railway construction going on in the Fort William district calls for a large number of men, and these are being procured from the ranks of the returning harvesters. It is estimated that at least 500 men will be drawn from this source and the railways are extending their cheap transportation for this purpose.

Transferring Your Product Efficiently

The Illustrations and Text Matter Describe How Users of Jeffery Equipment Overcame Their Haulage Problems. Perhaps You Can to Advantage Utilize Similar Methods in Your Plant

By J. H. MOORE, Associate Editor Canadian Machinery

THE problem of hauling your product from department to department is one well worthy of consideration, and the field that the electric storage battery locomotive occupies in this regard is already too well known to need comment.

Where the plant is of any real proportions an electric locomotive becomes almost a necessity if one wishes economical handling, and the purpose of this article is to present more in illustrated form than anything the advantages of such a system.

Before going on to describe these various photographs, let us first consider how one plant saved $60.00 daily by using locomotives.

The Park Falls Lumber Co. save 16 men and 18 horses each day by the use of Jeffery locomotives. This, they figure, saves them at least $60.00 every day. In some cases the track is as long as 1 mile, and a total mileage of 4 miles stretches throughout their yards.

Numerous other examples of saving could be quoted, but the one example will do in this case.

As everyone will agree, labor is scarce, making it necessary to increase the output per man. There is no doubt but what one man and a locomotive will do the work of many men, quicker, cheaper, and with less trouble and supervision.

FIG. 1—5-TON STORAGE BATTERY WITH CANOPY.

Referring to Fig. 1 we see a 5-ton locomotive equipped with canopy. It is capable of hauling 240-ton miles on level tracks on a single charge. If the battery is boosted at double normal rate for one hour in the middle of the day, it will be able to do 300-ton miles. A locomotive of this weight and battery capacity is very serviceable in climates where severe snows, storms, and low

FIG. 4—CONTRAST THE SPACE BETWEEN LOCOMOTIVE AND WAGON AND TEAM.

temperature are encountered and where haulage conditions become severe.

Fig. 2 illustrates an installation of a 5-ton Jeffery storage battery locomotive, used by the Oil Well Supply Co. of Oil City, Pa., to transfer various classes of material about their plant.

One cannot help but save money and time with such a system. It might be well to mention that these locomotives work on a track gauge of 20 inches.

The Columbia Plate Glass Co. finds this system of locomotive haulage to work to advantage, and Fig. 3 shows one such installation.

The space occupied by the industrial locomotive is also a big feature, for looking at Fig. 4 we cannot help but see that the locomotive and its train of cars do not take up as much width as the wagon and team of horses. When looking at this photo it is well to remember that the locomotive and its cars are nearest the camera, which further emphasizes the point already spoken of.

Last, but not least, we will consider Fig. 5. Here we see a view of the Seaman Sleeth Co., Allegheny, Pa., who, as can be noticed, handle considerable large castings. A Jeffery storage battery provides the hauling in this plant and results in considerable saving.

In conclusion we might say that when looking over your hauling problem, remember that the field which the industrial locomotive covers is well worthy of consideration.

DRAFTING COURSE RE-OPENS

CANADIAN MACHINERY Drafting Course reopens in the Sept. 18th issue. This will be welcome news to our many students who have been following up these studies, and now that the evenings are becoming much cooler, there is no reason why every reader interested cannot buckle down to work again, and send in his drawing plates.

When we commenced this course we hoped for considerable interest on the part of our readers, but the resulting interest shown has far exceeded our most sanguine expectations.

Students from one coast to the other are following up this course, and sending in their plates. We started to count our plates by tens, but soon hope to count them by the hundreds, as interest in these studies has grown by leaps and bounds.

You may perhaps have overlooked the possibilities of this course, and so far may not have started in to follow it up. Naturally you would not care to jump in at Part 8 without a knowledge of what came previous to this. But this fact need not deter you from entering, for we have prepared reprints of our former seven parts specially to help out such readers who did not grasp the former opportunity.

These reprints are absolutely free, and may be had for the asking.

We wish to impress readers of CANADIAN MACHINERY with the fact that our aim and object is service. This course is but **one form of our service, and originated by us.**

A course of such a nature as we are giving would cost you considerable money through any other channel, so why pay out big money for something you can secure for almost nothing?

If you are already a student make up your mind to plunge in afresh on the 18th, or if you belong to the class who have not yet started, write us for a set of reprints and get busy on this course right at the start.

We offer three prizes for the three best plates received on each part of the course, this being another feature which appeals to the reader.

We have yet to announce some prize winners on remaining plates. This will be done in our Sept 18th issue, so watch and see if your name is up in the honor roll.

WELDING AND CUTTING

The Judgment of the Oxy-Acetylene Process

The Views of the Technical Engineer on the Above Subject. Briefly, the Judgment Arrived at is That the Oxy-Acetylene Process is an Engineering Success, and a Fine Commercial Asset

By ALFRED S. KINSEY, Member A.S.M.E.

THE mechanical success of a mechanical process may depend on two factors, its utility as determined by the manufacturer, its efficiency as judged by the technical engineer. No one knows better than does the owner of the metal working plant or the superintendent of the repair shop how great the need has been for quicker and more thorough methods of manufacture and ways of making repairs, and few have looked forward with greater interest than has the mechanical engineer to the coming of safer and more efficient mechanical devices and processes. One has been the stimulus of the inventor, the other the surety of the manufacturing world.

The technical engineer's position in this progressive age requires no evaluation, his critical scientific attitude no defense. His is the problem of casting beyond the superficiality to the durability of things, from the flimsy to the substantial. Unquestionably this has produced in the engineer a conservatism, a habit of close enquiry which make for safety and success. The manufacturing world, therefore, still seeks the judgment of such a mind, and the technical engineer's endorsement is often final. It may be of interest, therefore, to learn what he thinks of such a modern process as that of oxy-acetylene welding.

Up to the advent of autogeneous welding the engineer had only his experience with the forge weld upon which to base his calculations and judgment. In a way this proved somewhat unfortunate for the new method of welding, as the forge weld had nearly lost its value as a dependable means of joining materials. Imagine two pieces of steel being brought to a soft, plastic condition in a forge fire charged with sulphur from the fuel, an excess of oxygen from the indifferently operated bellows or fan blower, the cinders and refuse of the fuel and one can readily realize the cause of weak forge welds. Such welds never were reckoned to have a tensile efficiency of more than about 50 per cent., and many observations of welds which had failed showed crystallization and even entrapped cylinders. Navy yards and many other large shops had practically abandoned the forge weld, preferring the expensive substitute of machining a job out of the solid when it was possible to do so. Serious failures of forge welds were too common. The author recalls many of these, and particularly one regarding which he assisted in a suit for damages where a hoisting hook on a city pier had parted at the weld, causing the death of a father of a family of small children. There was a demand for a safer and more efficient way to weld steel and wrought iron.

Then, too, in those earlier days, the only metals which could be welded were wrought iron and steel. There was no way to weld cast iron and the non-ferrous metals like copper, brass and aluminum. The mechanical engineer, of all men, realized these limitations. He knew that the time was ripe for a new method of welding materials.

Then came autogeneous welding and cutting by the oxy-hydrogen process, soon to be superceded by oxy-acetylene, thanks to the electric furnace's efficient method of producing calcium carbide, and making acetylene a commercial possibility. From that time, practically only about fifteen years ago, metal workers, manufacturers, engineers, nearly the whole industrial world, have eagerly watched the progress of the oxy-acetylene process.

The mechanical engineer recognized at once that there were certain fundamental principles involved in oxy-acetylene welding which were new to shop practice such as:

First, that autogeneous welding was accomplished by fusion instead of plasticity. The old method required that the metal be heated merely to a soft, pasty condition and then hammered or pressed together, while the new way was to melt the metal and flow the two ends into one mass. By the former method there would not be a thorough mingling of the grains of the metal, because it was only plastic, and besides there was every opportunity for such a weld to receive gas and fuel impurities from the forge fire. By the new process there could be nearly perfect rearrangement of the grains due to the liquid condition of the metal. The mechanical engineer recognized at once, however, that while the fusion of castings for welding would be consistent with the method of their formation, that is, that both the original metal and the weld itself would be in the cast condition, this would not be true in the case of the welding of rolled or forged wrought iron or steel. There the two pieces of rolled or forged metal would be joined by a cast weld, the former being fine grained and strong, the latter of coarse grains and reduced tensile strength. This was not a new situation to the engineer. The benefits derived from hammer refining the grains of steel are well known. An ordinary machinist hammer, therefore, proved to be the cure of this trouble, and it may be of interest to relate that in some experiments performed during the past year by the author for the Air Reduction Co., of New York, at the shops of the Baltimore & Ohio Railroad, at Marinsburg, West Virginia, and at Brunswick, Md., some worn railroad frogs which were built up by the oxy-acetylene process, and allowed to cool directly from the liquid to the solid condition, lasted only a few weeks in service but when a progressive method of building up and hammering was resorted to some of the frogs lasted over nine months in continuous severe service.

Second, that as fusion was the chief requisite of a good weld, the new process might be used to join other metals than wrought iron and steel. This opened up wonderful possibilities, new indeed to welders, for cast iron and the non-ferrous metals had not yet been welded. Would it be possible for the new welders to learn the marked differences of characteristics of steel, cast iron, copper, brass, aluminum? We

*Professor of Shop Practice, Stevens Institute of Technology, Advisory Engineer Air Reduction Company, 120 Broadway, N.Y.

have but to call to mind the work being done in the welding of iron castings alone to get an answer and to form an idea of the possibilities and value of the oxy-acetylene process for the welding of cast iron. The author recently had to do with the oxy-acetylene welding of three broken cast iron cylinders of freight locomotives, which cost $515 to weld and put in good working order, but would have cost $3,600 to replace by new cylinders if oxy-acetylene welding had not been available, leaving out of consideration the long delay in getting the locomotives back in service by the old method of making repairs as compared with the few days' lay up for welding.

Third, that the gases used in an oxy-acetylene torch operated by inexperienced welders might easily be made to lower the value of the weld. Many of the first oxyacetylene welds were badly crystallized. The engineer knew this and waited for developments. The first designs of torches were much to blame for this condition, but the inexperience of the welder was more so. It is not unusual now to find oxy-acetylene welds so homogeneous as to make it practically impossible to see any difference between the original material and its weld.

Fourth, that unusual problems of expansion and contraction must be reckoned with in the job welded by oxy-acetylene. No one would attempt to dispute this. The cautiousness of the engineer in this regard may well be understood. It has required an experimental experience to master these difficulties, but they do not stand in our way now.

Fifth.—That the heating of the oxy-acetylene weld was accomplished by the powerful quick-acting flame instead of a slow forge fire. It was readily seen that a trained eye would be required to bring about good results from the working of the metal in the molten conditions. What would happen if the metal were overheated? What if the original metal were not thoroughly melted when the molten rod was dropped upon it? A man must know more than a blacksmith about hot metals to be an oxy-acetylene welder. Could such men be gotten and could their skill be relied upon? We know the encouraging answer to these questions now, but they recall to some at least the time of not so long ago when the mechanical engineer struggled with his welders to teach them the difference between molten metal and burnt metal. We venture to say that it will be much easier to make good oxy-acetylene welders from now on than it has been heretofore.

In this connection it may be of interest to describe the results of some work performed by the author, as an effort to help win the war. At that time, as you know, there was a great need of the use of the oxy-acetylene welding and cutting of metals. Trained welders were scarce and many men were being pressed in the work without proper knowledge of the way it should be performed. At the request of those in charge of these men it became our privilege to form a night school for oxy-acetylene welders at the Twenty-Third Street Y.M.C.A., New York. The course consisted of lectures on the metallurgy and general principles of the work, followed by the actual use of the welding and cutting torches on special jobs in the shop. We took in men who were working on war orders in the shipyard and other large shops, and also other men who would learn to be welders and take positions in the shops doing war work. Over 200 men were trained the first year, about 75 per cent. of whom proved to be successful welders so far as we have been able to follow them up. It was easy to see why these men were failing in their daily labors with the torch, and their rapid advancement after a few evenings of instruction clearly proved the importance of a special training in the subject. As a more marked illustration of the value of such a training, however, we may mention an experiment in this same evening school of a special class selected from the non-essential industries. The men had been earning a livelihood as furniture salesmen, laundrymen, hat dyers, printers, bookkeepers, waiters, plasterers, signalmen, art students, saloonkeepers, etc. Seventeen out of the twenty in the class became good welders, and went to work in shipyards and shop with a zeal that was surprisingly new to them.

To continue this subject a bit further it will be apropos to call attention to the attitude of the technical engineer toward the teaching of the oxy-acetylene processes in the engineering colleges. Some of these institutions were not slow to grasp the importance of the subject. The Stevens Institute of Technology was probably the first college to take up the work. The author has lectured for about ten years on the subject as head of the department of shop practice in that institution, and some time ago we added a course of jobs to be welded by the oxy-acetylene torch which every student at Stevens has been required to take. We have heard of other engineering colleges who have introduced such a course, and we understand that Harvard's new engineering school is about to include oxy-acetylene welding in the instruction of its shop department.

In college and abroad in the world of engineering construction and repairs the technical engineer has been giving careful thought to the possibilities and advantages of oxy-acetylene welding. He has encouraged its trial in shop, foundry, and manufacturing plant. He has studied its evolution from the rough joint of doubtful value to the homogeneous weld of nearly 100 per cent. efficiency. If he has been conservative in his judgment it was because he knew better than others of the undeveloped parts of the new field being entered by the welder; if he has appeared to be slow to accept the process for the most important high-pressure and high-tension work it is because he has waited to prove that the new welder could measure up to his increased responsibility. One thing he will not do, he will not forget the inherent crudeness of the work, nor the varying personal errors of the best workmen and expect impractical refinements. A small fraction of sulphuretted hydrogen and phosphoretted hydrogen in the acetylene or a little difference in the purity of oxygen will not disturb his acquired confidence in the possibilities of a good weld by the new process. He has learned to appreciate the difference between a 50 per cent. plastic weld and a 90 per cent. fusion weld.

The author has discussed oxy-acetylene welding with many of the leading technical engineers of the country, men who are in responsible charge of immense engineering plants. Five years ago almost all of these men would have advised a delayed acceptance and further study of the advantages of the process. To-day they do not hesitate. Their minds are made up. From study and experience they speak, and because of the nature of the heat supply, which can easily be made a non-oxidizing reducing flame, because of the effect of the process on the physical efficiency of the actual weld, because of the portability of the welding apparatus, and because of the economy of the process their judgment is that the oxy-acetylene process of welding metals is an engineering success and a fine commercial asset.

AIRPLANE DEVELOPMENTS

The following statement of the National Advisory Committee for Aeronautics shows the development in airplanes which has been made since 1903. The first man-carrying airplane flights were made in December, 1903, with the Wright Bros. engine, developing 12 h.p. and weighing 152 lb., or 12.7 lb. per h.p. In 1910, the average horsepower for aeronautic engines had increased to 54, and the weight had decreased to 5.7 lb. per h.p. After another 7 years, in 1917, the average power output had advanced to 243 h.p., and the weight had decreased to 2.8 lb. per h.p.

In March, 1918, the Liberty motor developed 432 h.p. for a weight of 808 lb., or 1.86 lb., per h.p. At present, the Liberty motor is developing a maximum of 450 h.p. for a weight of 825 lb., or 1.83 lb. per h.p.

The average consumption of fuel decreased from about 0.8 lb. per h.p. in 1903 to 0.55 lb. in 1918, and for the Liberty engine to 0.50 lb. The present consumption is about 0.46 lb. per hr.

For one horsepower of energy expended $500 worth of textiles is produced, $300 worth of iron or steel, $1700 worth of printing. In the textile industries, where the cost is not exceptional, the cost per horsepower is calculated to $20 or $30, indicating a power cost of 5 per cent. of the total cost of production. Development of a river of electrical energy is suggested stretching from New England to the Southern States, and the transformation of coal to power in the mining fields, instead of transporting it over the railroads to factories far and near.

DEVELOPMENTS IN SHOP EQUIPMENT

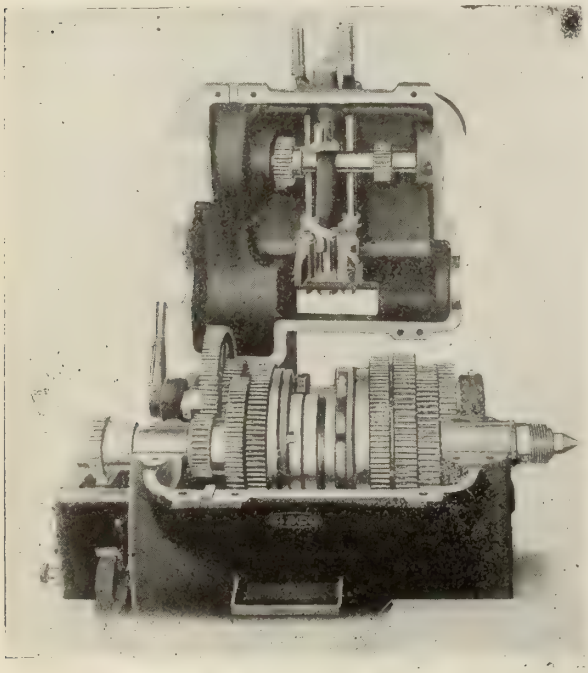
GEARED HEAD LATHES

Lathes with geared heads for either belt or motor drive are announced by the Cisco Machine Tool Co., Cincinnati. The geared head on the belt-driven machine has a double friction countershaft, one friction running 300 r.p.m. and the other 130 r.p.m. The 300 r.p.m. friction has control of 10 spindle speeds, 300 and 200 with back gears out, 214, 146, 116, 78, 54, 36, 29, and 19 with back gears in.

The 130 r.p.m. friction has control of 10 spindle speeds, 130, and 88 with back gears out and 93, 63, 50, 34, 23, 15, 12 and 8.5 with back gears in. There are four levers, including the back gear lever, required for these changes. One handle controls the friction on the spindle and two handles control the shifting of four back gears on the eccentric shaft. A pull pin in the face gear is used to run straight from the spindle when the back gears are out. The eccentric shaft lever or back gear lever meshes back gears with spindle gears. On the spindle are a friction and six gears, on the back shaft four gears, on the drive shaft two gears, all gears and spindles being of 0.40 to 0.45 carbon steel. Except the drive shaft gears, which are rawhide, all geared heads have ball bearings.

In applying the motor to the geared head a plate is placed on the top of the regular geared head with a bracket on the plate for an intermediate stud. On the intermediate stud is a rawhide intermediate gear. A pinion is placed on the motor and a gear on the drive shaft, both pinion and gear being made of steel. The gears are covered and the spindle speeds are 220 and 150 r.p.m. with back gears out and 158, 107, 86, 58, 40, 27, 21 and 14 with back gears in.

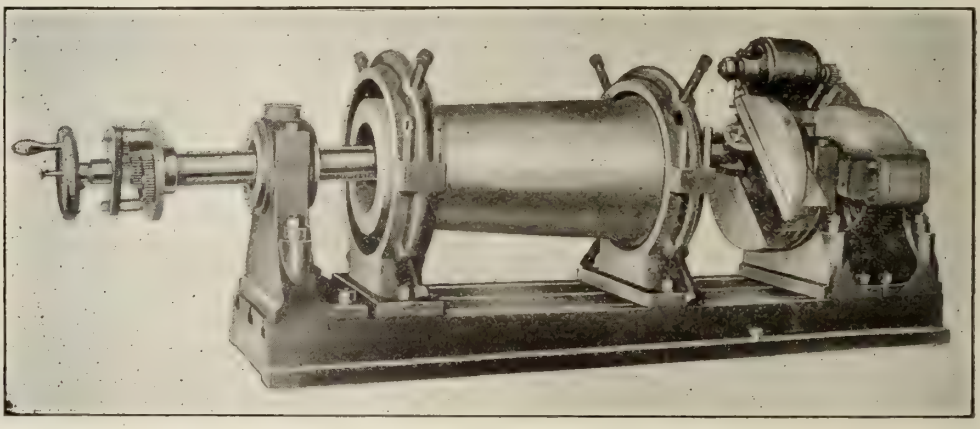
The lathes are made in four sizes, 14, 16, 18 and 24 in. For motor drive, these lathes require a 2½, 3, 5 and 7½-h.p. motor respectively. The manufacturer specifies a General Electric motor at 1,700 r.p.m. for direct current or a Westinghouse motor at 1,800 r.p.m.



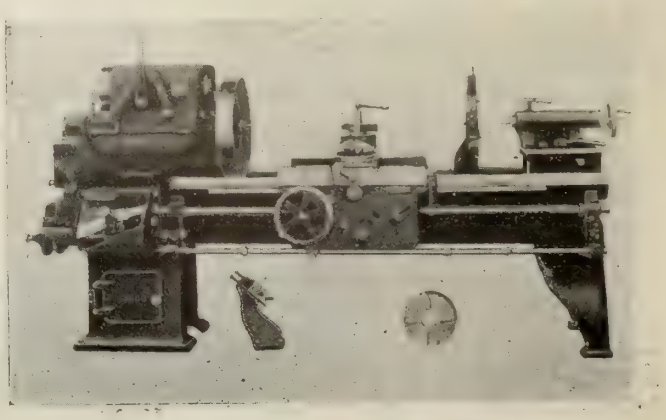
INSIDE VIEW OF GEARED HEAD.

PEDRICK TAPER BORING MACHINE

A horizontal taper hole boring machine, which is suitable for boring any taper that is ordinarily used in machine work, has been designed and built by the Pedrick Tool & Machine Co., 3639 N. Lawrence St., Philadelphia, Pa., and is here illustrated and described. The machine is simply and rigidly constructed. The boring-bar and driving mechanism are supported by three pedestals which are mounted on a bed-plate. The boring-bar is connected to a sliding block on the faceplate by means of a strongly constructed hinge joint. The degree of taper to which the work is to be bored is determined by the distance that this sliding block is moved away from the centre of the faceplate; thus it is obvious that when the sliding block is located in the centre of the faceplate, the machine is adapted for straight boring operations. The boring-bar is supported



GENERAL VIEW OF THE BORING MACHINE.

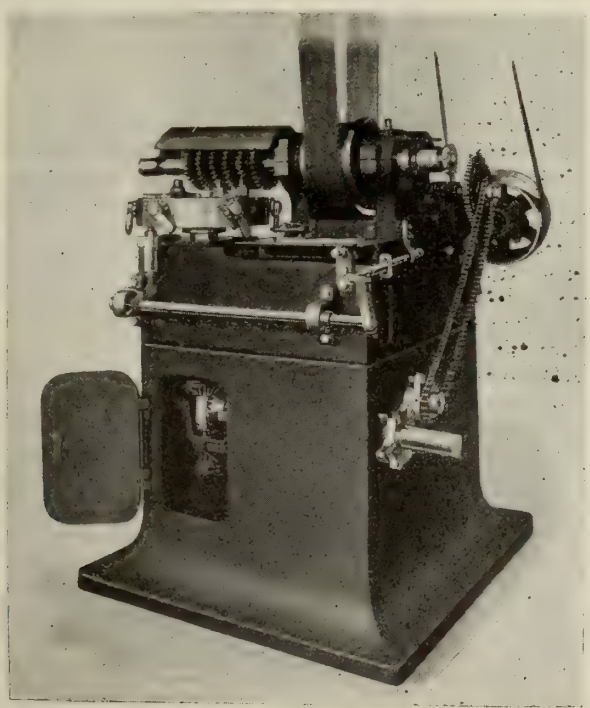


GENERAL VIEW OF THE LATHE.

in a pedestal at the rear end of the bed by a bearing which has been designed to permit the necessary oscillation or orbital movement of the boring-bar. The feed-screw which traverses the cutter-head along the boring-bar is imbedded in a grove in the boring-bar. The feeding mechanism located at the rear end of the boring-bar controls this feed-screw by means of a constant automatic movement which is changeable to permit the taking of roughing and finishing cuts. The work is supported on two steadyrests which are also mounted on the bedplate. The bedplate is 28 inches wide by 96 inches long; and the boring-bar is 3 inches in diameter. The cylinder, which is shown on the mounted machine, was bored a distance of 30 inches, the bore being 12 inches in diameter at one end and 9 inches in diameter at the other end. The machine may be equipped for either belt or motor drive.

SEMI-AUTOMATIC MILLER

The F. C. Sanford Manufacturing Co., 2060 Fairfield Ave., Bridgeport, Conn., has developed a semi-automatic milling machine for the milling of valve heads, lock nuts, or work of a like nature. This machine has a sliding head which carries the arbor, which in turn carries a gang of six side-cutting mills. The table consists of a chuck having six sets of jaws. To operate the machine the operator places the work in the first set of jaws.



GENERAL VIEW OF THE MACHINE

At the end of the reverse stroke, the chuck or table turns one-sixth of a circle and automatically locks. The head advances and No. 1 hub is faced on two sides by cutters No. 1 and No. 2. On the second stroke the table has made another one-sixth of a full turn and the second two sides of No. 1 hub are milled by cutters No. 3 and No. 4, as well as the first two sides of hub No. 2. With the third stroke, the table has made its full half turn and the last two sides of hub No. 1 are completed, the second two sides of hub No. 2 and the first two sides of hub No. 3.

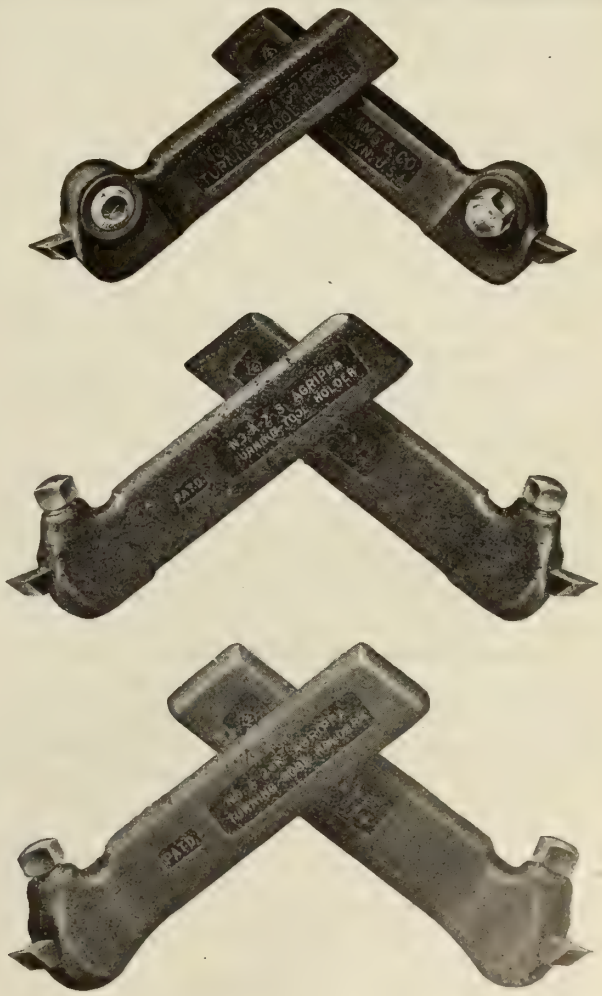
"AGRIPPA" TURNING TOOLS

J H. WILLIAMS Co., manufacturers of dropforgings and drop-forged tools with plants at Brooklyn and Buffalo, N. Y., have added a line of Set Screw Pattern Turning-Tools with right and left-hand offset and straight shanks, to their present well-known "Agrippa" Tool Holders. These latter already include a full line in a wide range of sizes for all regular machining operations: Turning, boring, planing, threading, knurling, cutting-off and side work. Several of these styles, among them turning-tools, are fitted with a cutter-fastening device in the shape of a cam (see cut) instead of the conventional set screw. The plans are furnished either of the hex head or headless type.

The nose of the holders, or shanks of both cam and set screw turning tools is broached to accurate size in special machines and provides an absolutely rigid seat for the cutter, a fundamental requirement in tool-holder efficiency.

For those who purchase cutters made of a steel rolled to the variation in size common to usual mill practice, the makers recommend turning tools of the cam-fastening pattern as giving the greatest economy, strength and economy. It is rapid and positive—the greater the pressure the tighter the lock. But the gradual rise of the cam, while providing great power, obviously limits its range of contact; consequently, where the size of steel used in cutters which are not ground to bearing size, as in turning-tools, varies beyond established limits, the markets offer this new line of Set Screw Pattern Turning Tools at the same price as for corresponding sizes of the Cam Pattern Holder.

The screws, made of a fine grade of alloy steel, are accurately machined and carefully heat-treated and hardened. They are unusually tough and strong and



beveled to permit their convenient use in close quarters. The tools are all drop-forged from a strong, tough grade of carefully selected steel and are submitted after forging, to a special heat-treatment or refining process which develops not only resistance to all wears but also the great strength necessary to overcome the pushing thrust imposed upon the cutters. The cutter-holding channel is carefully

give the maximum efficiency obtainable from this type of cutter-fastening.

"Agrippa" Cutters, made from high speed bar steel are cut to the "diamond point" form or bevel. They thus provide for the most common requirements with a minimum of grinding for either right or left-hand usage; also the full extent of economical service that distinguishes this superior line of tool holders.

Making War on Accidents

THE farms of Ontario have more accidents than its factories.

The accidents in United States are more serious and numerous than its casualty list in the war.

That latter statement can easily be substantiated by figures taken from the nineteen months during which United States was a participant in the war.

In that period 50,150 Americans died in battle, or as a result of wounds received in action. During that same period in America, approximately 126,000 men, women and children lost their lives in accidents. Of this number two-thirds were killed in accidents outside of industrial plants.

The Census Bureau of the United States Department of Commerce keeps a close record of accidents, and it is worth while knowing just how people do get mangled and killed. Taking as a basis a group of 100,000 people, here are some of the things that have a fairly high average:—

Falls: 14.8 per 100,000, or a total in the last year for which figures are available, of 11,114.

Railroad accidents: 11.5, or 8,649 in the year under review.

Others follow in this order:—

Burns: 9.1, or in a year, 6,830.

Auto accidents: 8.9, or 6,724.

Drownings: 7.4, or in all, 5,550.

Machinery accidents caused 2,112 deaths, or 2.8 per 100,000, and this rate compared with other years, is considered high.

It is gratifying to know that real progress is being made by some firms in cutting down the number of accidents in their shops. For instance, R. G. Adair, safety engineer of the American Rolling Mill Company, at Middleton, Ohio, has been able to make a worth-while report for the first five months of the present year.

This report shows a reduction of 91.9 per cent. in the total compensation paid by the company during the period mentioned, a reduction of 46 per cent. in the total number of lost time accidents and a reduction of 51 per cent. in the total days lost as the result of accidents.

Perhaps the most striking item in the tabulation is that showing a total outlay for compensation of accidents amounting to $1.71 for the month of May, 1919, in a plant employing 3,500 men. The decrease in accidents shown in Mr. Adair's report is all the more significant in view of the fact that the 1918 figures, which are used as a basis of comparison, show a relatively low accident experience.

In the five months of 1918, compensation amounted to $20,638.22, against $1,340.26 this year, making a reduction of 91.9 per cent.

Total lost time, accidents in 1918 (5 months) 210, against 83 this year.

Total days lost in 1918, 2,523, against 868 this year.

The business of making the shop a safer place to work has made big strides in Canada. The Western mining field was for some years a leader in the business of killing men. There are rows of little black crosses dotting the foothills of the Rockies that tell their own story all too well.

But we are passing the stage where the big chance or the little chance is left open. Of course there is always the fool-killer around the premises. It seems well-nigh impossible to weed him out. A fresh batch is always on the incoming freight.

It's a great work, though, making conditions such that a man is less likely to lose a limb or his life while out making a living.

The Trade and Technical Papers

THE position and business of the trade paper is coming to be more and more recognized by those who have occasion to dig beneath the surface in any particular line, and get down to real facts.

The trade press does not appeal to the mob. It is not a political organ, nor is its purpose merely to entertain. Its mission is to present information along specific lines, to publish the views of men who have succeeded, to give methods and schemes for doing mechanical things the best and most efficient way, to make a mechanic a better mechanic or a salesman a better salesman. In reality the trade paper is the medium through which the man who wants help can get it.

In the Ohio State University Department of Electrical Engineering there is a course in industrial lighting. The literature sent out by the University has the following in regard to the assistance the University authorities are getting from the trade press. Referring to the rapidity with which accepted theories and practices are being scrapped to make room for new ideas, the University letter says:

"One result of this rapid development is that the best available textbooks are to a large extent out-of-date before they are off the press. We are, therefore, confining the work of the course mostly to these letters and to that most up-to-date form of technical literature, the trade publications. We are fortunate in the large amount of good material that is available in the lighting field."

In other words, the trade press is regarded by the Ohio State University as being of more importance than all the textbooks that are coming off the press, because it can keep up to the minute, while a textbook has to stand for certain stated beliefs, even while the procession passes along and leaves those beliefs old and without a following. Again, the University authorities can have

no ulterior motive in stating their views on the matter. They are out to secure all the information they can along certain modern problems. They want to bring to bear on their problems every bit of worth-while knowledge they can secure, and their tried experience has been that they find this material in the trade press.

That is exactly the work CANADIAN MACHINERY is trying to do. If there are new ideas being brought out, new machinery, new devices, it is our business to get them for our readers. If our readers know of new things or better things or more efficient methods than are now practised, we want to hear of them.

The trade and technical paper is the friend of the man who wants to go farther up, and the men who have succeeded in going farther up are the best friends and most constant readers of the trade and technical papers.

Ingenuity Displayed By Native Races

THE possession of a wonderful mechanical sense by more or less primitive races is referred to in an interesting manner by an editorial writer in *The Practical Engineer*, a British publication. Where native labor is employed on engineering works, cases arise where it is wise on the part of the supervising engineer to leave the overcoming of certain difficulties to the solution arrived at by the native mind. Interesting instances of the successful application of this policy are mentioned. There is the case of a dam in Egypt, which was giving trouble through leakage, though the exact spot where the weakness existed was not apparent. A native Egyptian employed on the job conceived the idea of coloring the water on the high side of the dam in order to detect the spot where the leakage appeared on the low side.

The engineering feat we hear of so frequently now of placing the centre span of a bridge by floating it on lighters to its place, and then raising it, was not unknown to the Chinese. In fact it is claimed that it was a Chinese who first utilized the buoyancy of lighters and the help of a tidal stream to place girders in this fashion.

Transporting a Lancashire boiler where there were no roads was encompassed by slinging it bodily on bamboo poles, and manning the poles with enough coolies to carry the weight. Naturally labor was cheap where this method was employed.

Transporting a vertical boiler up a hillside was done by the Chinese headman by means of what we would call parbuckling. The boiler was laid on its side and ropes were passed around it, one end of the rope being made fast to convenient trees, the other end being taken round the barrel of a winch. The winch being started winding in the rope, the boiler naturally rolled up.

This does not seem to us to be nearly so good an instance as the next one, which showed really excellent mechanical thought. This case was of a nine-ton flywheel, which had to be taken to the summit of a hill. Obviously such a wheel was too heavy to take any chances of rolling it up, as one slip would have meant disaster. The Chinese headman was told to get it up, and then left to his own devices. He immediately proceeded to drive strong stakes into the hillside at long intervals, leaving them about three feet above the surface. He then secured some screwed pipe, and screwed a flange on each end of a piece just long enough to fit over the stake. To the top flange he fitted long bars to act as capstan bars. The wheel was then raised by levers, and rollers fitted under it as it lay on its flat. The rope was attached, and the loose end passed around the improvised winch on the stake. Enough men were then placed on the capstan bars, and the order given to heave away. The men walked round and the flywheel came up the hill. When it had reached the stake it was chocked up, the rope let go, and the winch was taken bodily to the next stake. The distance apart of the stakes was limited by the length of the rope available. This was about as safe and quick a way as could have been devised by any one under the conditions prevailing, and was thought out and adopted by a man who had never heard of the principles of mechanics.

On Regulatin' Prices

IT is a joyful thing, for sure, to read in these here times of how they're treatin' profiteers to jail terms and to fines, and makin' them loose up a spell and drop their ponderous wad, and get right out to earn their bread by gougin' up the sod.

With pure delight I scan them things, I read 'em line on line, while chills of pleasure and of joy they camp upon my spine.

Ah, well, it's time some move was made to shove us folks ahead, and push away the clouds that hang and bump upon our head; it's time they made our dollar sprout like some sweet-smelling vine, for it has shrunk to most like two nickels and a dime.

I wish them men would give to me a seat upon the board that's goin' to boot the prices down and scatter out the horde. I'd like to hear 'em call me out: "Old top, come have a seat, and use your brain to regulate the price of hay and meat."

I'd wiggle my big ears, I would, and hear the widder's cry about the price of liver a-campin' far too high, and then I'd set at once to work upon my new board seat to see that folks like me and you could get enough to eat.

I'd say to them what carve the cows, the rooster and the swine, that pounds of pork chops hence shall sell for just one single dime. A luscious T-bone steak I'd mark with paint and letters bold, and tell 'em that for fifteen cents that there thing should be sold.

I'd go unto the grocery store and say: "You grocery man, just yank the prices you've struck upon each prune and fig and can, and take 'em quick from out of here; forget your glorious days, and I shall teach you, yes, by gum, to walk in humble ways."

I'd take the hands of time quite rough and wind 'em back a spell before I'd give them grocery men the high sign for to sell. The good old days, the grand old days I'd bring back with a bound, when butter dished up in a boat at 20 cents a pound.

I'd travel up and down the street, I'd visit every place, and buyers would be cheerin' me, a smile hung on their face.

And for my friends what like to smoke I'd surely do a turn, rememberin' cabbage leaves and truck and all things that would burn. The cheers would rise up like a cloud, they'd come from near and far, as I led back to life once more a good five-cent cigar.—ARK.

THIS country's big chance now is to get down to the business of production. Labor trouble is righting itself, and Canada should be in a position to go in and supply the demands of nations that must purchase immediately.

It is difficult to harden a long, thin piece of steel without considerable warping. This is due to the cooling of different parts at different times, producing internal strains. If the red-hot piece is allowed to slide into the liquid on a chute held at an angle of about 45°, it will strike the water, end foremost, and cut into it at once. This gives better results than dropping it directly from the tongs, as the latter allow it to tilt, which will keep it from cutting in sharply and delay the contact of the liquid with some parts of the surface, thus causing warping. The chute may be a piece of scrap iron or tin, about 2 ft. long, bent up on two sides as shown.

MARKET DEVELOPMENTS

Machine Tools May Go To Higher Mark

Makers Expected Reductions in Labor and Material Following the War, But They Did Not Come—Preference For British Goods in Many Places, But There is Difficulty in Getting Deliveries

THERE is business in this country for British firms, providing they can supply the material, and meet any reasonable demand for delivery. In many cases it is a fact that the price is not the determining factor. One dealer this week stated that his house was constantly coming in contact with firms that expressed a preference for British-made goods. He instanced a case where equipment is required for a ship. Here a wait of as long as six months would not be objected to provided delivery could be definitely promised. Dealers who have been handling British lines, however, report very little improvement in the matter of securing the material they want. Any improvement that can be made on the part of the British firms, it is safe to say, will meet with a quick response in this country.

The future of machine tools is just a little uncertain regarding the important matter of prices. Following the war many makers, anticipating a drop in wages and the price of raw material, made a reduction of their prices. The reduction did not come in wages and material, and the makers are growing weary waiting for signs of this taking place, although they do not wish to put prices up. New York advices state that there will be increases in many lines of machine tools that will bring them back to where they were in war days.

Canadian bar mills are well booked with business just now, in fact it is likely that when they go out after business again it will be at an increased rate.

The scrap metal market is doing a fair amount of business, and that is about all that can be said for it. Shipping that is being done by the larger dealers to points outside Canada is on contract only, and new business is not being taken on. Prices show no change, and there is some dullness hanging over the whole market.

MORE STABILITY NEEDED TO BRING MONTREAL MARKET BACK TO NORMAL

Special to CANADIAN MACHINERY.

MONTREAL, Que., September 11.—Trade conditions are still influenced by many factors that tend to extend the period of uncertainty through which we have been passing during the past season. Local labor disturbances are not of a character to seriously affect conditions, but the activity in the district reflects the unsettlement that prevails in other places. Strikes and unrest in the States have been indirectly responsible for the dullness that has prevailed in many Canadian centres, and while this is not pronounced there is every reason to believe that industrial activity would be on a larger scale if normal conditions were more uniform. Transatlantic freight traffic has been seriously handicapped through continued strikes in many of the British dockyards, resulting in delays that have been reflected on this side. Passenger sailings have been interfered with, and in consequence mail has frequently been carried by cargo steamers. The situation is improving, however, and shipping companies are generally in a position to accept all freight offered for European ports. Plenty of space is available to South American ports. Business activity is of a normal character at present but trading is invariably based on present requirements, as conditions are not conducive to the covering of future needs. Steel business is steady but sales do not indicate any large development of a specific character. The non-ferrous metal situation is quiet with normal demand. Machine tool requirement is largely for single tools, but distribution is quite extensive. Second-hand demand has shown a falling off. Scrap continues listless with the market firm.

Activity on a Pre-War Basis

"While there has been no outstanding development in the steel situation as affecting local conditions, the volume of trade is of a normal character, and compares favorably with pre-war movement," remarked a dealer to CANADIAN MACHINERY. "The present requirements of the trade would signify that the greater percentage of material demand is of a general nature and more in the way of general maintenance than the development of new activities." The feeling that industrial unrest is still a factor in the iron and steel market is still prevalent, and dealers are inclined to suppose that this will continue to be an influence in fall trading. The present movement for conciliation between capital and labor in the States is looked forward to with interest as early future conditions hinge on a satisfactory settlement of this momentous problem. However, it may be said with some assurance, that the possibility of actual strife in the steel industry is less likely now that the President has taken a hand in the matter, but time alone can show what the outcome will be. The local movement of iron and steel commodities is principally in small lots, and no particular class predominates. No price changes are reported but those prevailing are firm in character.

Metals Steady and Firm

Normal business marks the trading in metals and in face of the quiet activity of the past week the market has been devoid of feature. The requirement of the consumer is light and only immediate or near future needs are considered. Quotations in most cases are firm, with the exception of aluminum, which shows a stronger tone, but the price is still unchanged. Antimony is going better, and prices have been marked up to 10

cents per pound. This is an advance of ¼ cent over last week.

Machinery Movement Steady

Dealers continue to report a fair volume of business in light orders, this demand emphasizing the wider distribution of general trade requirements, this being a very encouraging factor in the transition period of readjustment. It is interesting to note that the balance of trade is gradually swinging around in favor of new tools, the inquiry for used equipment being less pronounced. The movement of second-hand machinery, however, is still a profitable factor of current business. Whether the difficulties associated with labor or the general changed conditions is the influencing factor, there is evidence that recent inquiry would indicate that the demand for labor-saving machines is steadily increasing. Where manufacturing is carried on on a large scale this feature is becoming emphasized. Supply demand is keeping up and prices on the average are well maintained.

Strength in Cast Scrap

The old material situation differs very little from that which has prevailed for the past several weeks. Trading is comparatively quiet and no pronounced activity is reported in any particular line. While business is not moving in any large volume the interest is sufficient to sustain the firmness in the market. There is still an uncertain atmosphere surrounding conditions in the States and this is reflected in local scrap circles. Cast iron scrap is most active and the demand is for considerable volume but well distributed. Small iron foundries are quite busy and their requirements are of a steady character. Machine cast iron has advanced $3 during the past week and local dealers are quoting $23 per ton. Stove plate shows a similar advance, the price quoted being $17 per ton. Strength has developed in wrought iron pipe, the quotation of $10 being an advance of $2 per ton. Old metal prices are holding firm on a steady but light demand. Aluminum is quoted up 3 cents, the price being 21 cents per pound.

POINTS IN WEEK'S MARKETING NOTES

New York reports that machine tool makers may announce an increase that will bring them back to war prices. After the war prices went down, anticipating a drop in wages and labor. These did not come, and makers are going to revert to war values.

—

Sale of small tools is rather dull this week.

—

Dealers report a strong preference for British-made goods, a willingness being expressed in some instances to wait for long deliveries.

—

Pittsburgh says that the chances of a strike in the steel business are becoming more remote for the present at least.

—

An advance has been made in bars by some of the makers amounting to about $2 per ton.

—

Scrap metal market is unchanged in price, and dealers are shipping only on contract.

—

For the first time in some months one Toronto warehouse has received a specification calling for acid plate.

FEELING FAVORABLE TO BRITISH TRADE

But Trouble is in Getting the Supplies Through at Present Time

TORONTO.—Weeks have been much the same lately, nothing has happened during the past few days to break the sameness. There is still a fairly good volume of business moving, and some very large contracts are being worked on just now. Warehouses have, in several cases, been asked to get ready to take care of fairly heavy specifications. If they materialize it is certain that the shops taking the work on will be well employed for the remainder of the season.

Machine Tool Prices

Although no general announcement has been made of an increase, there is a feeling in machine tool circles that a rise is likely to come in the very near future. Deliveries are not as good as they were some time ago, in fact it is a notable thing that each successive month makes delivery dates a little less satisfactory on several lines.

Again, it is pointed out that the prices of some of the machines were put down after the war by the makers, on the assumption that the prices of labor and material would soon drop. These latter things have not taken place, with the result that prices of many lines of machine tools are likely to be placed back almost at the point where they were during the period of the war, when a person had almost to have a Government order and a Government shot-gun in order to secure any of the much-wanted machine tools. It must be said that there is a tendency in many circles to keep the prices down, it being felt that further increases now will not help matters. There are times when intimation of a price increase will help to close up a lot of business that has been lying around. There is a case in point right now, where notice was given that a machine used largely in the publishing business was going to be increased in price. The selling price as a general thing has been around $2,700, and the proposed increase was going to be around the ten per cent. mark. The result seems to have been that every prospect in sight was closed with, and the firm is now swamped with the business that resulted. That is generally the way of the market, but in the machine tool field just now, salesmen find it harder to get any more for machine tools than the present lists call for.

Want Old Country Material

One large warehouse reports that it finds a strong desire to secure Old Country material in many cases.

This house reported that it ought to be easy for a British house to come in here and do business, as there are many cases where specifications ask for these lines. Dealers who have been handling British lines, in some cases exclusively, report that it is a serious matter for them to get shipments through, regardless of whether the price is too high or not. There are certain lines of steel, cutlery, etc., on which it is impossible to secure deliveries. From reports that these agencies have in this country improvement is slow in Britain, and they can see no reason for expecting anything like a real improvement in the near future.

Asking For Tenders

Some boiler work may be placed in Canada for shipment to Egypt. The specifications for this call for acid plate. This is about the first time in months that the firms asked for figures on the business have been asked to supply this particular kind of plate, as practically all the plate business is straight basic. There are not many mills where the acid process plate is turned out, and the price charged for it will be about $1.50 per hundred above the basic.

Reference was made in the markets of last week in regard to business for steel for a bridge in an Ontario city, and as far as can be learned that business has not been placed. One dealer took it at 3.10 laid down in Peterborough, and apparently depended on being able to place the business at one of the Ontario mills at a price that would allow him a profit at the 3.10. One mill replied with a 3.23 price in Peterborough, while the nearest another of those able to handle the business would come was 3.13. Just what the holder of the contract is going to do with the business remains to be seen.

There is a feeling of more confidence in the steel market, as there seems to be no likelihood of a strike at the mills for the present at least. A week or so ago the Canadian selling agents of some of the U.S. mills seemed to be certain that there would be trouble. Some of the warehouses here were none too well fixed for material, and prospects of a strike, or of a holdup of material were not pleasing. Warehouses in several cases are buying heavily at present, preferring to get their stock in good shape while they can do so, and before there is any tie-up of the transportation system. It cannot be said that they are looking for increased prices, although bars do look as though they would not stay long at present figures, one Canadian mill al-

ready having announced an increase of $2 per ton.

The Supply Market

There has not been a very brisk selling of small tools during the last week. Nearly all the dealers in this district report that trading was a little off color, and they are at a loss to give any good reason for it. It may be that the fair had interfered largely with business or that the holiday season has not been fully concluded. Business in certain of the establishments that are running to capacity, such as the automobile shops, is good, and buying is satisfactory.

Metals in Demand

The metal situation (non-ferrous) is reported satisfactory. There was just a little doubt as to the course of copper a few days ago, it being held that it was at its peak and was likely to recede. The trade here is not disturbed, electric being quoted at 26c. There is a good demand for the other metals as well, with prices unchanged.

Scrap Market Quiet

Business is fairly good in the scrap metal market, and this is about all that can be said for it. The larger dealers are shipping to the United States market, but only on contract, and no new business is being taken on for the present. It looked last week as though some reductions might be made in certain lines, as there was an apparent weakness in the lists, but this has not taken place. Rather have some places made slight increases.

Copper continues to be fairly strong. There is quite an amount of copper turnings yet in this country, the property of the U.S. Ordnance Department. A certain part of this has been disposed of, but sales have not been made against the entire holdings. As far as the shell steel scrap is concerned, the market has been cleared out, as all that the U.S. Government had stored here has been sold or removed, while that of the British Government has in a large measure been shipped back to Britain.

NOT LIKELY THAT THERE WILL BE ANY STRIKE IN STEEL MILLS AT PRESENT

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., Sept. 11.—The labor situation in the iron and steel industry is greatly improved. The universal opinion among manufacturers is that a general strike, such as was threatened, is out of the question. There may be sporadic outbreaks, as there have been in the past three months, but there may even be less of that than there was.

At no time was the balance of probability that there would be a strike. At Youngstown it was thought at one time to be "50-50," but Youngstown is the worst place in the country in that respect. It was there that the riots occurred at the beginning of 1916. Now the chances, taking the industry as a whole, are practically insignificant. Of course, no prediction can be made for any length of time, for there may be new developments eventually, but as to this particular strike that the labor agitators have been endeavoring to foment, it would have occurred before this if it was going to occur at all.

There was quite a complication of events, as detailed in last report, with the strike committee seeking to arrange a conference with Judge Gary and threatening strike if the conference were not arranged, at the same time that Samuel Gompers, President of the American Federation of Labor, with his more moderate views, returned to this country, and President Wilson issued his appeal that there be a truce in labor disputes.

The outcome was that the strike committee did not call any strike. Why they did not nobody but the labor people knows. It may have been through realization that calling a strike would not produce a strike, or through Mr. Gompers refusing on general grounds to sanction a strike, or through the issuance of the President's appeal showing that a strike would be ill-timed.

After the hand seemed to be played out the strike committee continued throwing down cards. They secured, under the headship of Mr. Gompers, an interview with President Wilson, seeking to have him endeavor to get Judge Gary into a conference, and then last Friday they sent a long telegram to the President at St. Louis, urging him to arrange a conference, and saying they had great difficulty in restaining their men at various points from striking. All along the Washington press correspondents have had the wrong view of this thing, and they seem to have taken seriously the agitators' bluff that they were having trouble keeping the men from striking. Everywhere else in the country the sun shines through the bluff, which is considered a cheap joke.

It may be taken that the whole matter rests for a time, or at least until after the conference, early in October, that the President has called, to be participated in by 15 men selected by manufacturing and financial interests, 15 labor leaders, and 15 men to be selected by the President himself. The object is to devise a solution for the whole labor matter, so that strikes and lockouts will be relegated, like wars, to the barbaric past. Naturally enough, however, one is inclined to be cynical. There have been great conferences before in Washington, aimed at accomplishing various things. However, the chief trouble is "unrest," time is passing and time has been expected to decrease the unrest.

Production

Production of pig iron at the beginning of September was at the rate of about 34,400,000 gross tons a year, against average rates of 32,650,000 tons in August, and 28,950,000 tons in July. The low point in production was at about the middle of May, since when there has been a constant increase to date. Capacity is about 44,000,000 tons a year, based on what the furnaces actually produced in 1916, working under 1916 conditions, with allowance for new furnaces completed. On that basis production now is at 78 per cent. of capacity, which would indicate 22 per cent. capacity idle. All the idle capacity, however, could not operate if they had a market for their product at present prices, because with wage rates so very high now the furnaces that employ much more labor per ton of iron produced than the generality of furnaces are at a much greater disadvantage than formerly. There was a time when the greater labor employment was more or less balanced by the much smaller capital investment, but the great advance in wages, with decreased labor efficiency, has altogether altered the balance. This might apply to something like 10 per cent. of the capacity, so that there remains a considerable volume of idle capacity that could come in if the orders were available. Such orders are not available, however, since buying now is on a limited scale. Consumers of foundry grades of iron are fairly well covered by contracts to the end of the year. Some of them are buying in a moderate way, finding that their wants are greater than anticipated when they contracted, or having concluded to end the year with a normal stock, when formerly they had counted on having practically no stock. Some sales into next year at advanced prices are reported, but the tonnages are small. There is little demand, and producers prefer to wait until they have a better line on their costs.

Steel Market Quiet

The steel market is quiet, there being only a very limited demand, as to new purchases, while on the other hand the mills have little to offer, being fairly well sold up to the end of the year. If the works that are in operation were producing normal tonnages there would be a good bit of steel available, but at nearly all plants tonnages are unsatisfactory, by reason of slackness on the part of labor. While 90 to 95 per cent. of the productive capacity is in operation, the tonnage output is 80 to 85 per cent., estimating capacities on the basis of what the mills were able to turn out in 1916, when manufacturing conditions were favorable.

Occasionally reports are circulated that this producer or that has advanced one price or another. Such advances, if actually made, are not suggestive of any general advance to come, for the leading producers are strongly opposed to advancing steel prices. On the other hand there is no prospect of any decline while conditions are as they are to-day.

Export Business

Export inquiry for blast furnace and steel mill products is about the same as formerly, which means that it is about

as good as could be expected in view of unsettlement throughout the world and the very unfavorable exchange rates on New York that prevail in several countries. Italian exchange is at a level that makes it the same as if exchange were at par and prices here were 88 per cent. higher than they are. Exchange in France is nearly as bad, and while London exchange on New York is much less distance from par, it is unfavorable enough to cause business to be held back. With a better exchange situation the export demand would be still heavier, but the exchange situation has not begun to improve, and it may get still worse.

MATERIAL AND WAGES FAILED TO COME DOWN AS TOOLMAKERS ANTICIPATED

Special to CANADIAN MACHINERY.

NEW YORK, Sept. 11—There has been a lull in machine-tool buying in the East during the past weeks, but the sales results of July and August have been quite satisfactory to a majority of American machine-tool builders. Deliveries have been extended on some lines to October and November, and despite present quietness the situation looks more promising to machine-tool builders and dealers than it has at any time this year. Some solution of the European exchange situation must eventually be found, and when this improvement comes there is bound to be a considerable demand from Europe for American machine tools. A good deal of this busines will come here because adequate financing probably cannot be arranged in any other country. The suggestion of Judge Gary, chairman of the United States Steel Corporation, in a speech at Boston that the dollar be made the basis of international exchange has been the subject of considerable comment in financial and business circles, and doubtless this or some other way will be found to restore the present unbalanced position of the money markets.

Higher prices for machine tools are expected to be announced soon by quite a number of makers. These advances will probably take effect by Sept. 15, and not later than Oct. 1, and will cover several important lines if not all. Machinery manufacturers throughout the United States have agreed that owing to the high cost of labor it will be necesary to make a general advance of from 10 to 20 per cent. This will bring many prices back to the level which prevailed during the war. The cost of machine tools under present labor conditions is from 60 to 80 per cent. labor and from 20 to 40 per cent. material. In many instances, manufacturers reduced their prices at the end of the war in the belief that labor costs would come down at least 25 per cent. This has not happened, but quite on the contrary labor costs have been steadily advancing and hours of work have been shortened in many foundries and machine shops.

The Government is now offering large lots of machine tools for sale through its various district offices, and this fact may be in some degree responsible for the falling off in demand for new tools.

PRODUCERS OF PIG IRON HOLDING IN SOME CASES FOR HIGH 1920 PRICE

BUYING of 1920 iron is meeting with difficulties. This is due to the attitude of producers, who. in many cases are refusing to make any quotations on next year iron. Some business has been closed in the East. Following are reports from U.S. points:

Philadelphia. — Producers are withdrawing from the market, or putting the price of their product on a basis that practically forbids buying. Ferro-silicon from Jackson County is unobtainable on account of labor troubles, and high silicon from Virginia is being used as a substitute. There is little buying. Sales include 500 tons Bessemer by an eastern maker, and 500 tons copper-bearing, low phosphorus at $35 furnace.

Boston.—There has been about 6,000 tons of iron placed during the week for 1920 delivery, but it has been divided among a comparatively few furnaces in small lots. Furnaces which were quoting from first half delivery have withdrawn and will now quote only on last half this year. 2.25 to 2.75 silicon for first half sold at $31.90 delivered. Same quality for last quarter $29 Buffalo.

New York.—Sales amounting to between 15,000 to 20,000 tons for first quarter 1920 have been made during the week. Prices ran from $1 to $2 higher than those for this year. Most of the business was in small lots running not over 1,000 tons. Many furnaces are withdrawing from the market for next year delivery. There is a good export inquiry, but little business is being placed.

Pittsburgh.—There is little transpiring in the market here this week, in fact this is about as quiet a week as has been seen this year. This has had some effect on prices, and 2,000 tons of No. 2 foundry sold at $26.75. Valley furnace is about 50 cents lower than recent quotations. An inquiry for 1,000 tons Bessemer is noted.

Buffalo.—The situation here is affected by the difficulty of obtaining ore. This is thought by furnace men to be only a temporary condition, but furnaces are refusing to quote on 1920 iron while this state exists. A stack that has been down since November last has been blown in.

Cleveland.—The placing of orders to fill up shortages caused by melters underestimating their requirements has caused the moving of a few small tonnages. New business is very slight, producers not wishing to quote for delivery next year, and melters holding back their inquiries till furnace men are ready to offer a price.

Chicago.—Demand holds fairly well here, a good number of melters having to come into the market to make up their requirements. Most of the furnaces are sold out, or nearly so, to the end of the year. Silicon differentials have been increased about $1 on each grade, but the basic grade remains the same. Silveries are in good demand.

Cincinnati.—Enquiries for first quarter delivery are fairly numerous, but producers are not willing to quote on these deliveries. Some malleable has been sold for 1920 delivery at an advance of $2. Car shortage is still causing inconvenience.

St. Louis.—Prices here continue firm, with a good demand for prompt shipment and over last quarter. The $27.75 schedule price with regular silicon differentials is being adhered to by some makers, but cases of shading on the differentials are not unknown. Inquiry for 1920 is represented by requests for 250 tons Southern iron for first quarter.

Birmingham.—Production in the South is increasing, and the market is stiffening too. There are about 26 furnaces now in blast. Fourth quarter delivery is the basis of most of the business being done. There is some inquiry for 1920, but no business being booked.

TRADING REPORTED VERY DULL IN "SCRAP"

THE scrap metal market seems to have struck a period of dull trading. Prices remain firm but are more or less nominal. Following are reports from various U.S. points:

Pittsburgh.—The market is in a dormant state, practically no trading being done. Dealers are not pressing sales and prices remain as they were. Government sales of shell steel have reflected conditions recently, 10,000 tons being sold at $20 to $21 delivered. Pennsylvania road is offering 20,000 tons, including 4,000 gross tons No. 1 steel rails.

Boston.—A quiet market prevails with some grades in fair demand. No. 1 machinery, turnings and borings are among these. Heavy melting steel has brought $16.50 to $17.50 from dealers. On Bessemer screw stock offered by the Government as high as $31 per gross ton was bid. Cotton ties for rebaling have sold up to $14 place of shipment.

New York.—Prices are not very clearly defined in a weak market. Stove plate and heavy melting are off about $1. A lot of 15,000 tons shell forgings were sold this week.

Philadelphia.—A much more confident feeling is evident in the market, due to

THE SCRAP MARKET

Continued from page 289

the idea that labor troubles are finally settled. Machine shop turnings have brought $15, on a lot of around 5,000 tons. Stove plate was sold at $21 delivered.

Buffalo.—Sales have been few, but prices are holding firm. Mills are using up stock from their reserve, and if the labor situation was clearer buying would become free again.

Cleveland.—As users pretty well stocked up on the recent buying movement, there is little strength to the market just now. Dealers believe that the depression will soon be over and the more favorable outlook for the labor situation inclines to optimism.

Chicago.—The market here has succumbed to adverse influences and has become comatose. The combination of holidays and threatened strike proved too much for business that was weak already. The only railroad offering is 2,200 tons by the Chicago and Northwestern.

Cincinnati.—The tendency is towards weakness, and especially in heavy melting. Cast borings are off about 50 cents a ton. Prices on other grades do not represent real quotations.

Birmingham. — Although consumers are offering better prices for heavy melting they are still $3 below the dealers' demand. No. 1 cast is in good demand and a little more life is apparent generally. Prices are stiffening on most grades.

MONTREAL NOTES OF THE WEEK

The Montreal officials and staff of the Canadian Export Paper Company, to the number of about fifty, spent a pleasant holiday on Labor Day at Grand Mere, Quebec, as the guests of the Laurentide Company, Limited.

* * *

Montreal citizens are again confronted with an advance in tram fares, the most recent demand on the people going into effect on the 15th of the month. The basis of the new rates will be a 7 cent cash fare, or 4 tickets for 25 cents.

* * *

Jenkins Bros., Montreal, have recently obtained a large order for valves from Cuba. It has been learned that considerable business in this connection is developing from South America and the West Indies. Plenty of shipping space is available for export in this direction.

* * *

Clarence I. de Sola, the Belgian Council in Montreal, has been honored with the Belgian knighthood by King Albert, being created Chevalier of the Order of Leopold in recognition of his valuable services to Belgium during the war. This title is the highest in the power of the Belgian monarch to bestow.

* * *

The municipal authorities of Sydney, N.S., have drafted a resolution for presentation at Ottawa, asking that a Royal Commission be appointed at once to probe the situation surrounding the closing down of the steel plant. The city is desirous of knowing when the works will be reopened, as many of the skilled workers are leaving the city.

* * *

Owing to the delays in sailings of passenger and mail steamers, caused by the labor troubles in British ports, the Canadian and British Governments are utilizing fast freighters for the transmission of mails. Recent fogs have held up some passenger boats as long as 50 hours, lengthening the journey from port to port to about 9 days, the time taken by a fast cargo vessel.

* * *

A record for quick loading of a cargo vessel has just been made at the port of Montreal, when the McLean-Kennedy freighter S. S. Alston was completely loaded with 7,000 tons of general cargo in 2½ days. It is generally conceded that Montreal port clears vessels two days quicker than New York or Philadelphia, but this recent loading is an outstanding achievement for vessel loading.

* * *

From a statement recently made by an official of the Canadian Pacific Ocean Service, there is every reason to believe that there is plenty of space available for the export of Canadian products. As a matter of fact, many shipping firms are looking for cargoes, and it would appear that the cry of exporters of lack of shipping space, due to the requirements of the Ministry of Shipping, is not warranted.

* * *

The Fraser, Brace Shipyards are deepening the basin in which they have recently been constructing wooden vessels for the Imperial Munitions Board and the French Government, and intend to make the present location into a permanent dry dock for the repairs and building of lake vessels. It is likewise possible that a plant will be erected for the construction of steel vessels for lake service; negotiations are now on for work of this character.

* * *

Announcement has been made that the plans and specifications for the new dry dock for Louisburg harbor have recently been completed and that they are now before the Federal Government for approval. When this has been given it is expected that work will be commenced at the earliest possible moment. About 800 men will be employed in the construction of the work. English capital is largely interested in the development.

* * *

The Montreal General Tool Company are now manufacturing the "Victory" water heating system, and they have constructed a system at the factory for demonstration purposes. They will carry on this new development in conjunction with their line of Talbot boilers, which are oil-fired. They have already obtained a large contract for installation in a new church to be erected in Notre Dame de Grace. This will be the first installation of its kind in Canada the fuel being crude oil.

* * *

W. A. Downing has accepted a position as sales manager with the Cutter and Wood Supply Company, of Boston, Mass. For the past three and a half years Mr. Downing has been associated with the Geo. F. Foss Machinery and Supply Co., of Montreal, in the joint capacity of manager of the small tool department and general advertising. Prior to his connection with the Foss organization he specialized in small tool equipment, acting in various capacities with many of the leading American can manufacturers.

* * *

A. G. Clark, who has been accountant for the Geo. F. Foss Machinery and Supply Co. for the past five years, will succeed W. A. Downing as manager of the small tool department.

* * *

A remarkable and commendable record for rehabilitation has been made by the Canadian Pacific Railway, as official reports up until the end of August show that this company has more returned men now employed than left the company for service overseas. The total number of men reported as joining the army was 10,538, and of this number over 1,000 have died, nearly 2,000 were wounded, and 5,024 have been re-employed. In addition to this 5,543 soldiers have been given employment who were not previously working with this company. This makes a total of returned men now working with the C.P.R. of 10,567. The policy of the company has been to re-engage the men in positions equally as good as the ones they left, and wherever possible the men are taken back to the same jobs that they had prior to enlisting, or others of a similar character.

Organization of Traders.—The Canadian Association of British Manufacturers and their representatives held their first meeting at the King Edward Hotel, Toronto, within the last few days. The membership is composed of between 300 and 400 British firms at present, but a drive will shortly be made to secure additional members. The meeting was presided over by John Wilson, who said in his address that in the opinion of some of the more optimistic members, the association was likely to become as influential as the Canadian Manufacturers' Association.

Industry for Sarnia.—The Loughead Machine Shop here has been purchased by the Seagrave, Ltd., manufacturers of motor trucks and firefighting apparatus. The new concern, which has several establishments in the U.S. and Canada, will be capitalized at $200,000, one quarter of which will be open to local investors.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

TRADE GOSSIP

New Brantford Factory.—A building for the purpose of manufacturing small motors and electric fans will be put up in Brantford by the Robbins & Meyers Co., of Springfield, Ohio.

Wants Information.—J. L. Perry, lumberman, of Westchester, Nova Scotia, wants to secure catalogues and literature from Canadian firms dealing in mill or woodworking machinery.

Oil Fire at Halifax.—The stills of the Imperial Oil Company at Woodside, opposite Halifax, were visited by fire, but fortunately it was extinguished by the company's own fire-fighting force before much damage was done. The company have a very large plant at Woodside, covering many acres of ground.

Motor Fuel for France.—Germany has to supply France with 30,000 tons of benzol annually under the Peace Treaty. The Government committee on petroleum proposes that this benzol shall be mixed with alcohol in the proportion of half and half, making a cheap national fuel suitable for car, truck or tractor.

Sugar for Canada.—There are four of the Canadian Government merchant fleet at present loading or on their way to this country with sugar. The total amount to be brought in during September will be 12,400 tons. The total for the season will be 32,000 tons. Almost all of this sugar is brought from Cuba.

Choice of Buildings.—The ratepayers of London will vote in January next on the question of spending $700,000 on an enlarged City Hall or build a $250,000 office building on the site of the temporary City Hall. The Mayor favors the office building, as, he says, the present day trend is towards municipal buildings for purely utilitarian purposes.

Up in the Air.—Through a strike of firemen operating the light, heat and power plant of the fifty-storey Metropolitan Life Insurance building, the occupants were cut off from communication with the ground except by means of the stairs. This lasted for about an hour, when a crew of strike-breakers were secured to take care of the 5 o'clock exodus.

Profitable Year for Municipal Line.—The auditors employed on the London & Port Stanley Railway have nearly completed their work, and it is understood that the result of the year's working will prove eminently satisfactory. This line, which is looked on as a kind of model for the proposed Hydro Radial lines, is keenly observed by the whole province.

Big Deal in Oil Stock.—The Commonwealth Petroleum Corporation, a newly-formed New York syndicate, has acquired the interests of Andrew Weir, now Lord Inverforth. Lord Inverforth was one of the largest shareholders in the Union Oil Company of California. The number of shares held by him was 37,500, which the Commonwealth Corporation bought at the rate of $160 per share, a total price of $6,000,000.

To Urge 36 Hours a Week.—The delegates of the Trades and Labor Council of Vancouver, recently organized by the international unions, are about to attend the conference of employers and employees at Ottawa. Their platform will consist of a demand for a 36-hour week, recognition of labor unions and collective bargaining, and the establishment by the various provinces, and not by the Dominion, of a minimum wage.

Britain and Canadian Cheese.—The British Ministry of Food has cabled the Canadian Government, stating that the Food Controller in Britain has definitely decided not to purchase the balance of this season's cheese after 20,000 tons have been secured. Any Canadian cheese imported into Britain after that will be governed by the maximum importers' selling price, as fixed by the British Government, which is at present 28c per pound.

The Victor Tool Co., Waynesboro, Pa., have recently made connections with the J. R. Stone Tool & Supply Company, 997 Woodward Ave., Detroit, Michigan, appointing them exclusive agents for the State of Michigan. They will handle the entire line of self-opening die heads, collapsible and adjustable taps, reamer holders and nut facing machines, and will carry a stock of these tools in their Detroit office in order to serve the trade promptly.

Labor Bodies Federate.—The labor interests in Brantford got together and held a meeting at which it was decided that the metal trades council, the Independent Labor party, and the various trade unions in the city will co-operate for political and other purposes. The Grand Army of Canada and the Great War Veterans were invited to affiliate with the labor men, and in the event of their constitutions preventing this, the invitation was extended to individual members of these bodies.

New Contracts.—A contract has just been concluded by the Department of Marine with the Collingwood Shipbuilding Co. for the construction of two ships of 3,750 tons each for the Canadian commercial fleet. The price is $180 per ton. Four similar ships were built by this company in war time, and the price then was $205 per ton. A contract has also been concluded with the Dominion Shipbuilding Co., of Toronto, for two ships of 3,500 tons each at the same price, $180 per ton. The above are the only contracts arranged for at present.

Drop of Nickel Output—The mineral production record of Ontario shows a decrease since the signing of the armistice. In the first half of this year the production of nickel matte dropped to 7,072 tons, as compared with 21,393 tons in 1918. The shrinkage of prices brought the value of the output down from $12,385,950 in the first half of 1918, to $3,535,915 for the first of 1919. A decrease was also noted in copper matte and silver, the latter being due to smaller output. The estimated value of all minerals was $18,759,000, as compared to $31,574,000 in the first half of 1918.

Vanadium Steel Co.—The "Financial Review" of August 30 says: The most active issue on the N. Y. Curb during the week has been the Vanadium Steel Company of America. This company has secured through purchase the mines and other physical properties of the American Vanadium Company. J. Leonard Replogle, Charles M. Schwab and Allan A. Ryan & Company, were the actual purchasers. The board of directors will comprise the above and T. Coleman du Pont and Harry Payne Whitney. Capital stock is 280,000 shares of no par value. This corporation controls about 95 per cent. of all vanadium produced. The Ford Motor Company is one of its largest customers. Mr. du Pont is interested in the General Motors Company and A. A. Ryan & Company, in the Stutz Company. The shares are quoted around $39.

MARINE

Port Colborne.—The tug Alert, which was sunk and turned bottom upward recently near Port Robinson in about 25 feet of water, was successfully raised by the Lebeau Wrecking Company and taken to Port Dalhousie for repairs.

St. John, N.B.—The St. John Dry Dock and Shipbuilding Company have purchased the dredge "Leaconfield." This vessel was formerly owned by E. O. Leahay and will be employed by the dry-

GEOMETRIC

Adjustable Collapsing Taps

Have overcome all the expense and annoyance of tapping screw threads with a solid tap.

Anyone doing thread tapping knows what backing out a solid tap each time means. It usually means low production, poor threads, and worn out taps.

The mechanism of the Geometric Taps takes care of adjustment to correct diameter each time a thread is tapped, it collapses the chasers automatically, leaving a thread clean cut and perfect.

The chasers are readily reground, and when finally used up, are renewed at comparatively small cost, leaving the tap as efficient as when new.

The manufacturers of the Geometric line of Collapsing Taps and Self-opening Die Heads are justly proud of the distinction which is theirs:—

The Originators
and the
Largest and Best Known Manufacturers
of
Automatic Threading Tools

For cutting all classes of screw threads, internal and external, of any diameter and form.

dock company on excavation work in connection with their operations.

Toronto. — The Canadian Government now has fourteen vessels carrying Canadian produce and manufactured articles all over the globe, and before the winter is over expects to have thirty-one vessels in commission. The operating policy of these vessels is to make them supplemental to private tonnage, and not a competitive one.

St. Catharines.—The "Dalhousie City" was unable to make her usual trip to Toronto from Port Dalhousie owing to propeller trouble. The dry dock at Port Dalhousie was engaged, preventing her being put in there for examination. Failing the necessary repairs being carried out expeditiously another steamer will be engaged to carry on the run.

SYDNEY, N.S.—A new drydock for the harbor of Louisbourg will be started by the beginning of 1920. The dock will cost $5,000,000 and the capital interested will be mostly English. Plans and specifications have been placed before the Federal Government, and the signing of a subsidy contract is all that is necessary, previous to work being commenced.

London.—The firm of Harland & Wolff are still expanding. They have now acquired two more yards on the Clyde, those of D. & W. Henderson Ltd., and A. & J. Inglis. They recently acquired the yard of Caird & Company, and are said to be interested in other Clyde yards. They are now strongly entrenched in Liverpool, Southampton, on the Clyde, and at their original works at Belfast.

New York.—Captain W. Hays, of the famous "Olympic," is coming to the States to enjoy a vacation on a New Jersey farm. Capt. Hays wears the Distinguished Service Medal for the services he performed in his gallant ship. She transported 250,000 troops, bagged five German submarines, and travelled 350,000 miles without convoy and without accident.

Ogdensburg.—The crew of the steamer "Toltec," of Buffalo, were landed at Ogdensburg by the Canadian Government steamer "Alert." The "Toltec," which was a wooden vessel, was on a voyage from Montreal to Buffalo in ballast, when fire broke out in the engine room. It spread so rapidly that nothing could be done to suppress it, and the vessel was beached near Prescott. The "Toltec" was owned by the O'Hagen Co., of Detroit.

Montreal.—The "Lake Fibre," built at Toledo, is now in Montreal loading a cargo of Canadian food products for Glasgow, Liverpool and London. The "Lake Fibre" is under the control of the United States Shipping Board and is one of the smallest of the ocean-going boats built on the lakes. She is of 1,588 tons net register, and her deadweight capacity is only 2,500 tons. She is fitted with oil-fuel and her winches are driven by gasoline engines.

Improvements at Water Front — The Toronto Harbor Commission have under consideration the construction of improving the harbor facilities in front of the Exhibition grounds. The idea is to construct a retaining wall at which ferry boats could land passengers from the city, and embark returning visitors for transportation to the city. The chief engineer will present a report shortly on the probable cost of the undertaking.

Montreal.—That there is plenty of cargo space available for shipments going to England is the statement of shipping company's officials. According to these gentlemen shipowners are looking for cargoes, and they are at a loss to find any explanation for the cry that has been going up about lack of space. The British Ministry of Shipping has cabled Canadian offices that they expect to be

satisfied with 50 per cent. space instead of the 60 per cent. they have been using.

Halifax.—Work at the Halifax shipyards is being carried on vigorously. The office and stores building are completed as far as the exterior work is concerned,. The concrete retaining wall is being rapidly completed and the bridge over the railroad tracks to give access to the dock and shipyard is now floored and the sidewalks put in. A flight of steps will lead from this bridge to the north ferry. The steamer ferry "Scotia" is in the dry dock receiving an additional fifteen feet to her deck.

Kingston.—The "Cabotia," which went ashore on the Main Ducks, about 500 yards from the lighthouse, is in about 12 feet of water and resting on rock. She is a total wreck, being full of water, and her stern opened up very badly. The Donnelly Wrecking Co.'s steamer Cornwall hastened to her assistance when she first went ashore, but owing to the high seas could not get alongside of her for some hours. She then took off the captain and crew and such equipment as could be readily handled. The cargo will be salved as soon as arrangements are made with the underwriters.

PERSONALS

Byron F. Stowell, for many years connected with the Hendee Mfg. Co., of Springfield, Mass., as master mechanic and mechanical engineer, is now associated with the Napier Saw Works, Inc., of Springfield, Mass., as mechanical engineer.

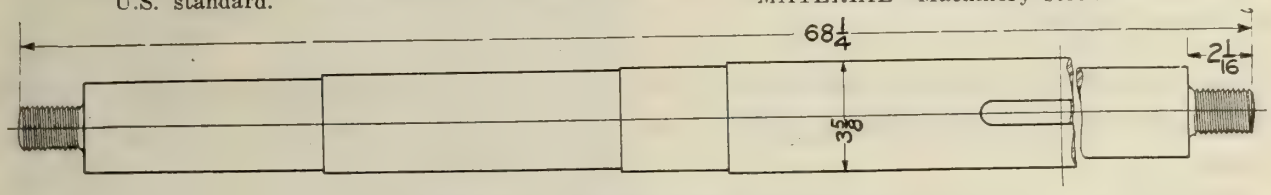
Smalley-General

THREAD MILLING MACHINES

Will give you a short cut to lower-cost thread milling.
Study the blue print and time study as given below.

MACHINE—Smalley-General Thread Miller No. 2.
THREAD—1½ in. diameter, 2 1-16 length, 6 pitch U.S. standard.

PIECE MILLED—Axle for tractor.
MILLING FEED—4.35 per minute.
MATERIAL—Machinery steel.



Tractor Axle Operation
TIME STUDY

5 minutes 37 seconds floor to floor milling both threads. Each thread milled in 65 seconds. Balance of time handling. Barker 3-jaw chuck used which had 12 in. unsupported overhang turn main spindle bearing to thread.

NOTE.—These parts were chucked through the rear end of main spindle. This was an awkward operation because the pieces were larger in the centre and the type of chuck would not let them through. A collet chuck with false collets would have permitted faster chucking.

Consult us on every phase of Thread Milling.

We will show you how to cut the costs.

Smalley - General Co., Inc., Bay City, Michigan

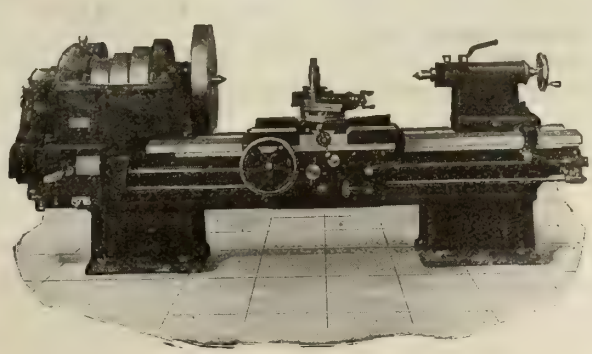
SIDNEY

Sidney for Service

Sidney-for-Service Lathes are noted for their power and rigidity. Take deep cuts through toughest metal without pause or chatter.



Specifications include 3-step cone, double back gear, semi-quick change gear lathe, built on 10 ft. bed. This lathe also furnished with quick-change gears. Bed lengths available: 10, 12, 14, 16, 18 and 20 feet.

The Sidney Line comprises 15-inch, 17-inch, 19-inch, 25-inch, 27-inch, 30-inch and 36-inch lathes, which are adaptable to the finest tool room work or the heaviest duty shipyard or factory rapid production work.

Have You Noticed?

In any conversation that is fairly general, some firebrand slashes out with condemnations right and left. What he says is interesting, but it isn't informing. Usually there is at least one man present who listens to the general villification thus started and then quietly brings out a point which causes all to pause and think.

This is the man with the balanced viewpoint—the man who gets to the bottom of things before condemning—who takes notice of the various influences at work.

It is this balanced viewpoint which is presented in the editorials of

THE FINANCIAL POST

Consider Some Recent Editorials:

Government Advertising and the C.P.A.
Responsibilities of Auditors.
Careless Methods of Manufacturers.
A Good Man Gone Wrong.
Dr. McFall's Profiteering Charges.
The New Liberal Leader.
Need for Thrift and Greater Production.
The Western Budget Supporters.
Taxation Discouragement.
The Standard Reliance Scandal.
A Shortage of Unskilled Labor.
Dangerous Juggling With Figures.

This is an age when many papers seem overly anxious to advocate what will be popular—to attack the "classes" and so to please the "masses." THE FINANCIAL POST'S aim is to get after the truth. THE POST frankly believes in capital. It believes capital has a right to a square deal, and that causing capital to fear for its future in Canada will do the Dominion inestimable harm. But THE FINANCIAL POST believes capital has obligations as well as rights, and holds capital—where necessary—to account.

You will find enlightenment in the balanced viewpoint of THE FINANCIAL POST'S articles and editorials. You will find its "Answers to Enquiry" department of value. THE POST is the paper for the thinker—be he rich or poor; the paper for the man who is eager to study not only what is best for his business, but what is best for Canada. This is the paper which you may receive weekly for one year at a cost of $3.00. Fill in the attached coupon:

Tycos
Multi-Pyrograph
A Multiple Record Pyrometer

Produces from one to six temperature records on one chart. Enables you to keep track of six heat treatment furnaces at one time, without leaving your office, and without depending on the fallible human element.

You know what the temperature should be—
the Multi-Pyrograph tells you what they are.

Checks operators and prevents disputes as to temperatures maintained. Insures future precise duplication of results and uniformity of product.

Some of the famous *Tycos* line of instruments for indicating, recording and controlling of temperature.

Tycos Mercurial, Recording and Index Thermometers for all industrial and laboratory applications.

Electric Contact Thermometers.

Temperature, Pressure and Time Regulators.

Mercury Column Vacuum, Pressure and U Gauges.

Tycos Base Metal, Rare Metal and Radiation Pyrometers (Indicating and Recording) Fery Radiation Pyrometers.

Hygrometers, Hydrometers.

Mineral Oil Testing Instruments.

Tell us your needs and let us advise you.

Nothing Else Like "W & B" Quality

A machinist soon recognizes "W & B" tools as superior in quality and workmanship. Because a workman is known by the tools he uses, he invariably selects "W & B", for he knows his work is best when his tools are best.

Our line of hammers and wrenches is complete and the quality consistent with an idea sixty-five years old. The idea is —

"Make it better than anybody else can make it,
put your name on it and stand by it."

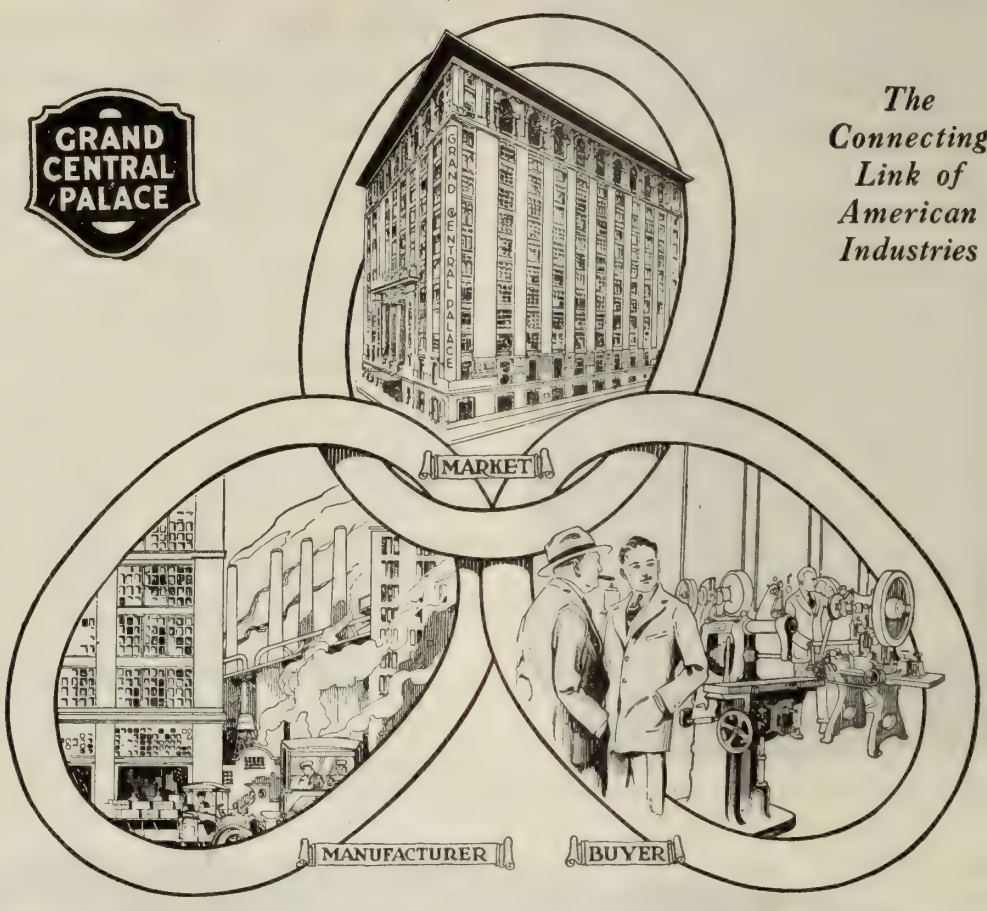
GRAND CENTRAL PALACE

The Connecting Link of American Industries



International Machinery Exposition

IN buying and selling much is claimed for "connecting links" of one sort or another —links between manufacturer and consumer. Now comes the strongest link of all —a proposition so sound, so logical, so progressive, that it commands your instant attention.

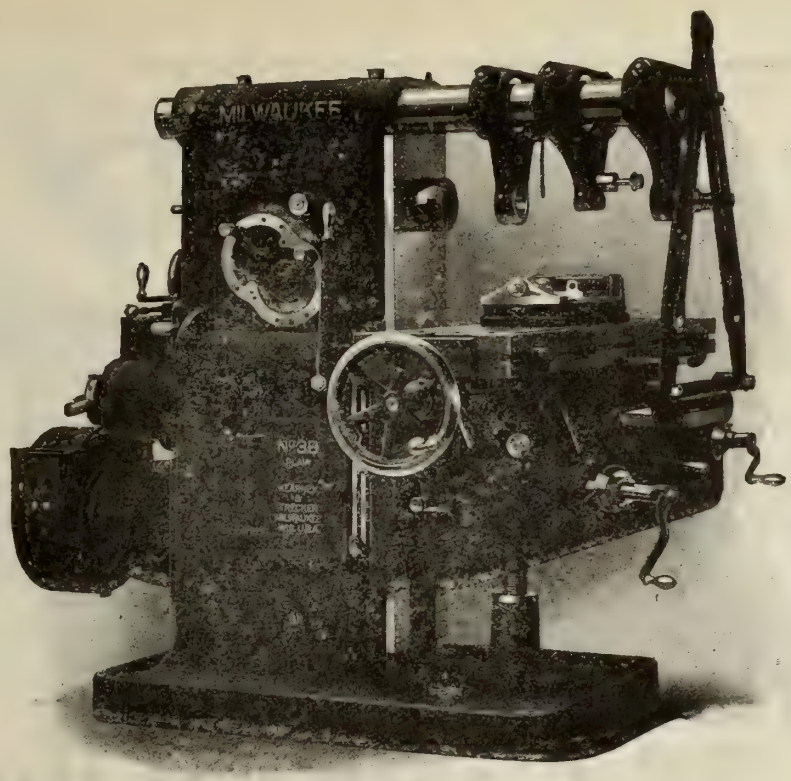
The INTERNATIONAL MACHINERY EXPOSITION, opening October 15th in Grand Central Palace, New York, is to be a huge clearing house where manufacturer and buyer will come into direct contact. It is to be one of the eight permanent industrial expositions in that largest of exhibition buildings, operated by the Merchants & Manufacturers Exchange of New York. It will be visited by buyers, purchasing agents, engineers, jobbers and dealers from all over this country and foreign countries.

Here, side by side, will be arrayed all that is best and most modern in engines, lathes, milling machinery, drills, screw cutters, hand and power presses, boring, can-making, wood-turning machines, etc.

You will want to visit this mammoth Machinery Exposition, as well as the other permanent expositions in the Palace this October. A wonderful opportunity invites the live manufacturer to place his products before the world's buyers. For information address:

International Machinery Exposition

Grand Central Palace, Lexington Avenue, 46th and 47th Streets, New York City



MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

KEARNEY & TRECKER CO.

MILWAUKEE, WIS. U.S.A.

Hose was hose — Till Goodyear Built it

THE GOODYEAR CORD TIRE of to-day would not have been possible had Goodyear been guided by the hide-bound traditions of the rubber industry.

Nor could Goodyear Industrial Hose ever have reached its high degree of perfection.

But Goodyear refused to be bound by precedent or trade prejudices. Hose fit to meet modern industry's varied and severe demands was our goal. Prevailing methods of construction would not do. Better methods had to be developed.

It was typical of Goodyear to study the hose requirements of industry exhaustively—to want to know exactly the conditions industrial hose must meet in use.

To discard existing processes of hose building, rubber compounds and cotton specifications and set new and more exacting standards—to develop more modern processes and methods of construction.

So you are offered the more efficient Goodyear Industrial Hose—hose that embodies all the virtues demanded by the strenuous needs of 20th century industrial life.

For foundry, paper mill, mine, railway, steel plant and every other industry there is a Goodyear Hose that will meet your needs more exactingly; that will give more lasting service.

Goodyear Industrial Hose will open up to you new possibilities of economy, increased production and hose satisfaction.

A man trained by Goodyear in hose problems will gladly call upon you without obligation.

Just phone, wire or write the nearest branch

THE NATIONAL ACME · COMPANY ·

DE COURCELLES & G.T.R. MONTREAL P.Q.

"can't afford them now, —when we get rich"—

Johansson

Mechanics who are now users of Johansson Gage Blocks will smile at the man telling our representative that he is going to wait until he gets rich before ordering a set of "John Blocks."

Of course, our gaging expert could have replied—"Without a set of Johansson Blocks you may never *get* rich."

Present users of Johansson Blocks know that this "can't-afford-it" argument is no real reason for not getting the Blocks—it's an excuse.

Putting off getting a set is merely putting off the chance to make more money by cutting down rejections. It is putting off the opportunity to stop the countless arguments about who's right and who's wrong in measuring. The idea is false that a set of Johansson Blocks is a luxury, only to be enjoyed by a shop with plenty of money. They are not a luxury any more than the typewriters in your office are a luxury.

Johansson Gages are a practical working tool for toolmakers and inspectors. "Not running fifteen minutes any day before somebody is after our Johnny Blocks," says the superintendent of a big toolshop.

The evidence is overwhelming that Johansson Blocks are an absolute necessity—not a luxury—in any up-to-date shop. All "regular" shops are entitled to at least one set—*at least* one set.

English and Metric sets to answer all requirements.

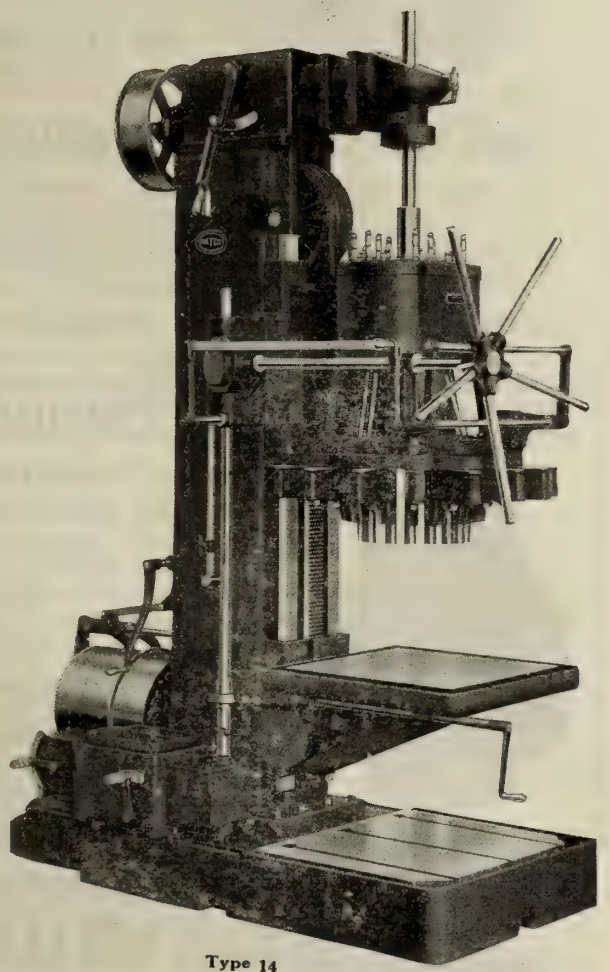
NATCO

Multi-Drillers

Multi-Tappers



Type 14

The Multi-Driller That Individualizes The Drill

Just as a man can only do his best and most productive cut when his working conditions are right—so a machine can only do its best and most productive cut when it operates under correct working conditions. With the NATCO Multi-Driller each drill has this advantage. It is individualized. It works at exactly the speed at which it cuts best. This is true no matter how many drills the machine uses—no matter how many varying diameters of holes are being drilled. And do not forget that the NATCO is the only machine with this patented feature. The only Multi-Driller with independent change of speed for each spindle.

NATCOS are built in 11 sizes ranging from 2 to 72 spindles

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

MAXIMUM EFFICIENCY IN BELT LACING
A broken belt won't hold up production long if you repair it with
Patent Steel BRISTOL'S Belt Lacing
Pronounced the most efficient, because it is the easiest, the quickest and the best to apply.
No special tool is required. Simply a hammer and a soft block of wood to drive the sharp, staggered steel prongs through the belt in double rows and to clinch the points. The belt is gripped firmly without danger of cutting or weakening.
Send for samples and Catalog I-707.

UNION GEARED SCROLL CHUCKS

have many points to recommend them. SOLID BODY —Gives strength and rigidity. WEIGHT—All parts are heavy and strong, and reinforced where necessary.

QUALITY OF MATERIAL—Best that can be procured.
LAST AND BEST OF ALL—ACCURACY. Union Chucks are Accurate.

UNION MANUFACTURING COMPANY
26 Cortlandt Street, New York

∴ New Britain, Conn., U.S.A.

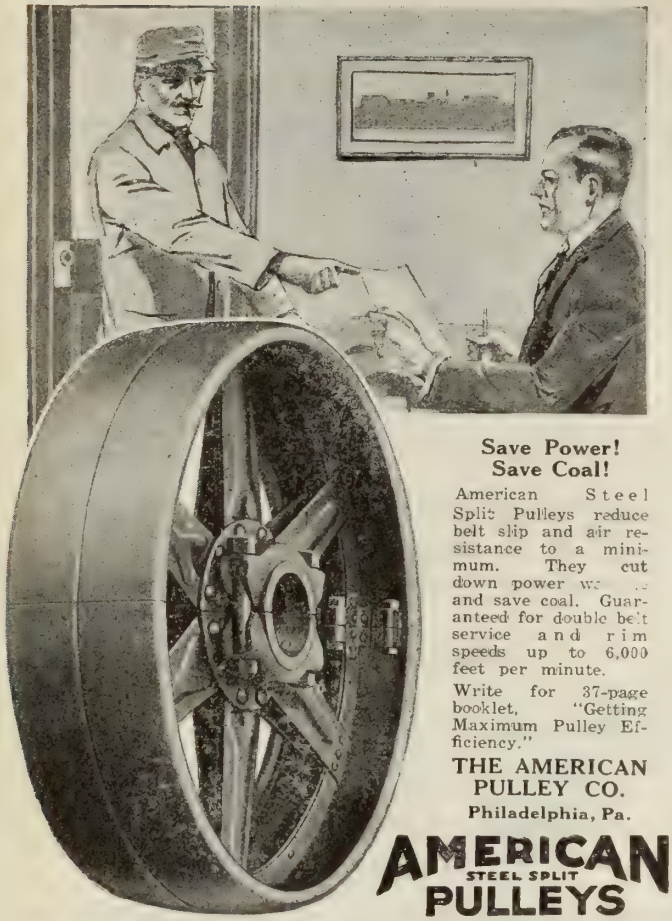
BABBITTS

Hoyt Metals have been used with great success for many years.
Put them to the test and you'll soon see a difference in your babbitt cost.
All elements entering into our mixtures are carefully refined and put together in such proportions and in such relation to each other that the best possible alloy is secured for the work for which it is designed.
Annual sales over $5,000,000.

Hoyt Metal Co., Toronto
New York, N.Y. London, Eng. St. Louis, Mo.



Save Power! Save Coal!

American Steel Split Pulleys reduce belt slip and air resistance to a minimum. They cut down power waste and save coal. Guaranteed for double belt service and rim speeds up to 6,000 feet per minute.

Write for 37-page booklet, "Getting Maximum Pulley Efficiency."

NORTON COMPANY. WORCESTER, MASS.

No. 68A

A FEW FACTS FOR THE FORGE SHOP

Because grinding wheels and machinery are used only occasionally and on a small scale in the average forge shop is no reason why fundamentals for correct usage should be completely ignored.

We advocate that some attention be paid the following details, not for any selfish reasons, but because it means dollars and cents in saving to the user:

1.—MACHINE CONDITIONS.

Whether the machines be of the bench or floor type they should be of heavy construction and anchored rigidly to the bench floor. This is to prevent vibration—a source of wheel waste.

Keep the bearings properly taken up so that no undue vibration comes from loose boxes.

Remember, vibration means waste of abrasive.

2.—WHEEL SPEED

The correct speed for wheels used in the forge shop is between 5000 and 6000 surface feet per minute. If possible, the R.P.M. of the grinding machine spindle should be increased as the wheel wears down, so that this speed is maintained as nearly as possible.

Slow speed make wheels act softer and hence wear faster.

Slow speeds cause wheels to get out of truth quickly—hence, out of balance. Often the wheel is accused of having hard and soft spots, when in reality it is not kept in truth.

Keep the rests adjusted close to the wheel face.

3. CORRECT GRAIN AND GRADE.

Good wheels for the forge shop at 36-O or 30-P ALUNDUM for off-hand grinding of chisels and tools. For grinding forgings 24-Q ALUNDUM will usually give satisfactory results. For the flashes left in drop forging or for sharper contact, use 24-R ALUNDUM.

These are but general recommendations and it is usually better to specify for each particular class of work and set of conditions after they are known.

We make ALUNDUM wheels to suit every job in the forge shop.

No inquiry is too small to receive the most careful attention of trained engineers. This branch of NORTON service is free to the inquirer, who has a difficult grinding problem and cannot solve it.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

Williams' "Vulcan"
Drop-Forged Safety Lathe Dogs

WHEREVER Lathes are used it is conceded that, no matter how good the machine tool may be, poor equipment makes its satisfactory operation difficult, if not impossible.

Why employ inferior equipment?—the best tools are always the cheapest in the end.

Williams' "Vulcan" Drop-Forged Lathe Dogs are absolutely safe and dependable. Their design, material and workmanship are the result of nearly half a century of constant effort to produce the best and only the best. Bent and Straight Tail—one or two screws, 16 sizes, 3/8 to 6 inches maximum capacities.

May we send you a copy of our Machinists' Tools Booklet ?

J. H. WILLIAMS & CO.

"The Drop-Forging People"

BECKER BELT-DRIVEN MILLERS
for

GREATER PRODUCTION because they work continuously—every hour of operation is a production hour—

ECONOMY OF OPERATION because they are power savers; the internal belt drive forms an elastic drive to the spindle that prolongs the life of the cutter by eliminating chatter and vibration.

ACCURACY because the machines have exceptionally fine feeds and are equipped with micrometer dials and stop gauges. The Patent Becker Gibbing keeps the work permanently aligned with the spindle.

IMPERIAL CARBIDE

For Welding Cutting and Lighting

HIGHEST GAS YIELD IMPERIAL CARBIDE MADE IN CANADA

It insures **effectiveness** and **economy** by **invariably** producing acetylene gas of **unusual purity.**

Manufactured by

Union Carbide Co. of Canada, Ltd.

Head Office: Dominion Bank Bldg. TORONTO, ONT.

Works: WELLAND ONT.

Large Stocks maintained at convenient distributing centres throughout Canada

PURE OXYGEN

Save money by using

Electrolytic Oxygen 99.80 Pure

Write for particulars and prices, also samples gladly given for testing purposes.

We also handle Pure Acetylene.

Carter Welding Co. of Toronto LIMITED

7-11 Sheppard St.

Dominion Foundries and Steel, Limited

Hamilton Ontario

Steel Products

Open Hearth, Basic and Acid, Electric and Alloy Steels

Castings

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons

Railway Specialties

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears

Forgings and Billets

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings

Plates

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon
Automobile Plates and Sheets

Agricultural Steel

Soft Center and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades

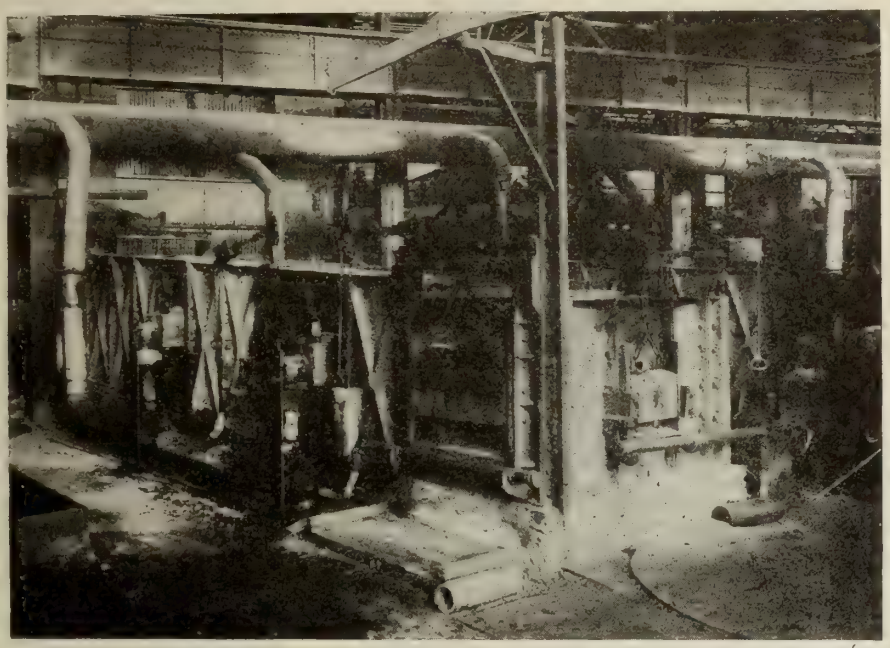
Another MECOL Furnace

demonstrated its superior features point by point to a group of men whose years of experience in the heat-treatment of metals made them appreciative judges. We refer to the "Mecol" Furnace shown in this illustration, installed at the Pointe St. Charles Works of the Canadian Steel Foundries, Limited.



Our intimate knowledge of heat-treating methods, and our long experience in the building of efficient furnaces fit us to give helpful advice—and that we will do promptly if you

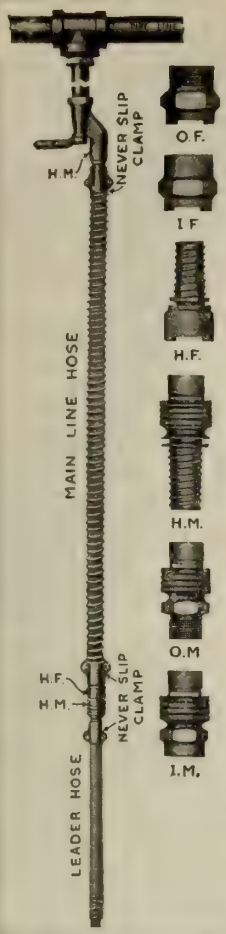
CLEVELAND HOSE SPECIALTIES



Bowes Automatic Air Hose Couplings

Standard Equipment Everywhere

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.
STYLE I.F. is an inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.
STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.
The Male and Female Ends of Bowes Couplings interchange in sizes ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

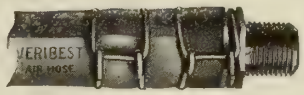
Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-in.

The Cleco Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

The adjoining cut of Cleco Never Slip Hose Clamp shows the "Flanges" which engage the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings and valve to use and proper way to attach the clamps.

CLECO GROOVED HOSE NIPPLE



Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently.

WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-pinion Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, etc.

Use Annealed Wire No. 14

Write for Bulletin 38 illustrating Cleco Hose Fittings, Couplings, Valves, etc.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Bulletin 34A, 41 and 43.

A. R. WILLIAMS MACHINERY CO., TORONTO, 337 Craig St., W., MONTREAL. WILLIAMS & WILSON, MONTREAL

Let them know it's there

In complimenting us upon the results secured from their advertisement in the classified section, one advertiser said:

> "Of course we would not have sold it without letting people know it was here, that is obvious, and thanks are due you for letting the people know it was for sale."

If you have any old or used equipment for sale, let people know it's there. Your message in Canadian Machinery will be placed before the probable buyers of such equipment.

DUNBAR SPRINGS

ACCURACY ASSURED

You can always depend upon Dunbar Springs being accurate. Before proceeding with any order the first few springs are carefully tested and checked up for this very purpose.

Seventy-two years' experience making flat and spiral springs of every description enables us to furnish you with springs of the highest quality, that can be depended upon under all conditions.

Send blue prints for estimates.

STAR LATHES

STAR TRADE MARK REGISTERED

13" x 6" ENGINE LATHE—

AN EXCELLENT TOOL FOR GARAGE WORK

It is a very satisfactory lathe for garage service because of its simplicity, the various attachments available and exceptional wearing qualities.

"Star" Lathes are economical. They do the work of larger and costly machines at a much lower cost and with greater accuracy.

May we send descriptive circular?

P⨯H

TRADE MARK

YOU WANT RESULTS

not theories. Every tool in your shop must give efficient and economical service, or they don't earn their "keep."

Files, for instance. Are you getting all you should do out of your files? If you are, we have nothing further to say, but if not, specify "P.H." and "Imperial" on your requisitions.

"THEY CUT FASTER AND WEAR LONGER."

That's the whole argument in a nutshell.

May we have the favor of a trial order to prove our contention?

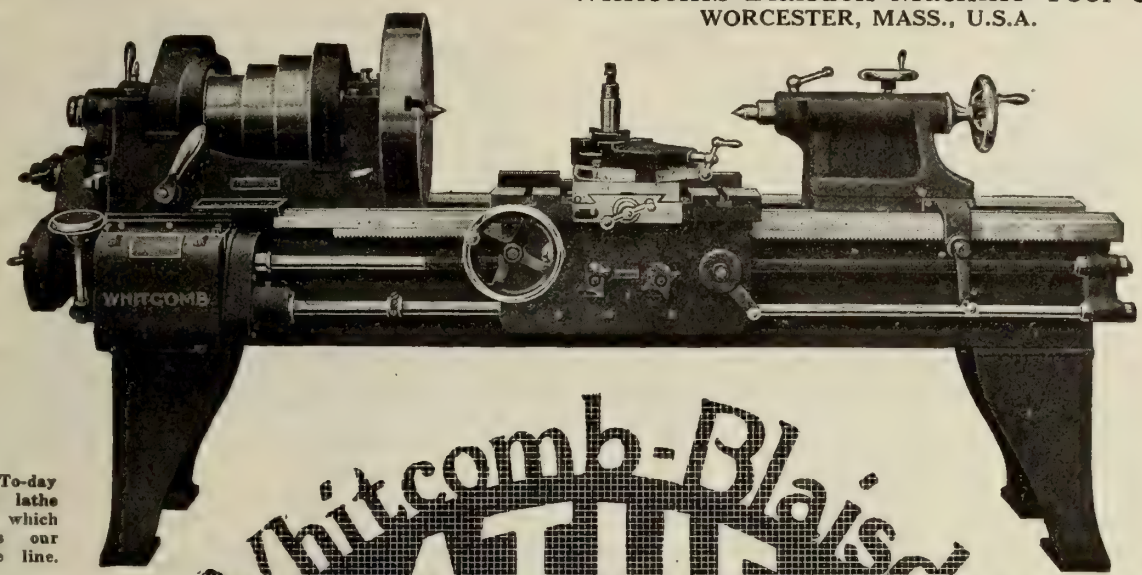
Adapted to all kinds of Rapid Manufacturing

WHETHER your lathe requirements must suit the rapid manufacture of intricate parts or versatile demands of modern tool room practice, one of the Whitcomb-Blaisdell Line will fit exactly your individual needs.
When you buy a Whitcomb-Blaisdell Lathe you get a big measure of service in return for every dollar invested. The entire line of W-B Lathes is distinguished for superior design, workmanship and material.
Rigid inspection and thorough working tests in our shops are your assurance of accuracy and dependability.

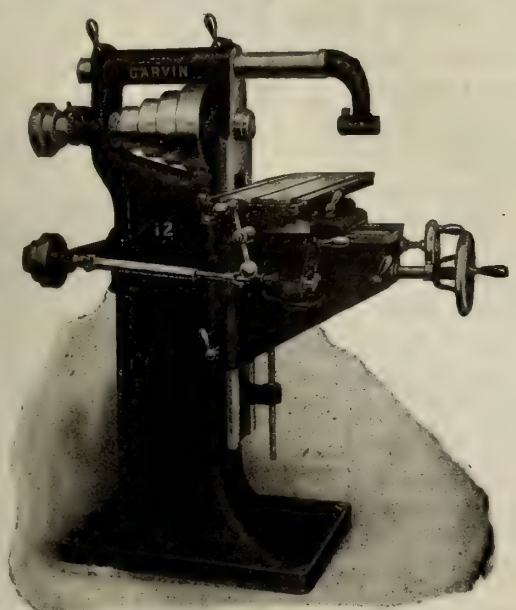
Whitcomb-Blaisdell Machine Tool Co.
WORCESTER, MASS., U.S.A.



Write To-day for our lathe Catalog which describes our complete line.

Whitcomb-Blaisdell LATHES

GARVIN



No. 12—Plain Milling Machine—Use Code Abrade

No. 12 PLAIN MILLING MACHINE
FOR ALL LIGHT MANUFACTURING

This machine is built especially strong and substantial for a tool of its capacity, and has many valuable features worthy of special mention. The slide is fitted with a quick pitch screw, giving one inch per turn. This combines the rigidity of a rack feed with the steadiness of the screw feed. The table has an oil pan all around it, with finished edges—automatic feed, trip and reverse—adjustable nut on the feed screw to take wear—the Feed Screw is hardened.

Adjustments ..... 18 x 6 x 15 in.

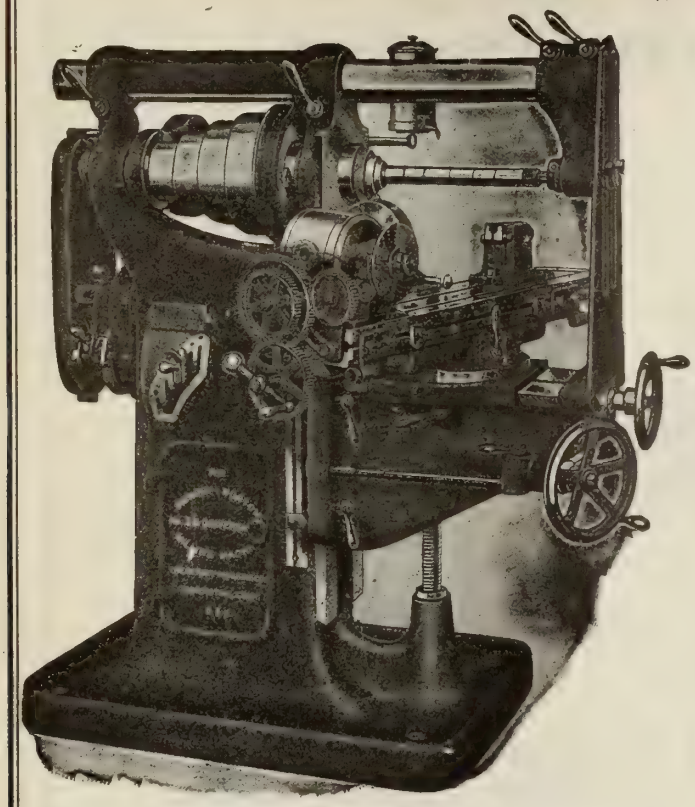
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

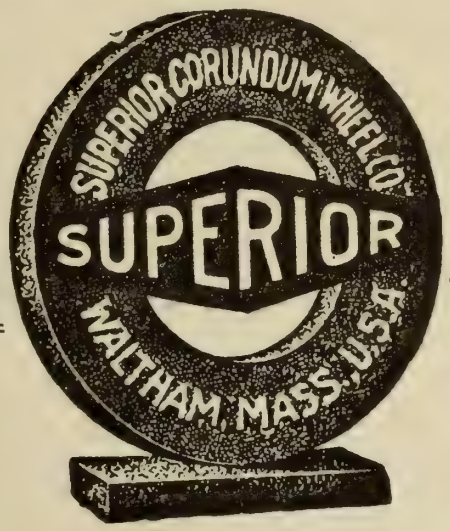
QUALITY Foss SERVICE

Foss MACHINERY AND MILL SUPPLIES

Foss

"Superior" Grinding Wheels



Fast and Cool Cutting

Durable and Uniform

Vitrified Silica or Semi-Vitrified and Elastic process.

Shapes: Dish or saucer wheels, cups and cylinders. Also special shapes for drill and tool grinders. All sizes, grits and grades, 3/8 in. diameter and up.

It is most important that the proper shape and quality of grinding wheel is used for every job.

"FOSS" Service gives special attention to using the right wheel in the right place. We have a large stock of shapes and qualities on hand for prompt shipment.

Tell us your needs and you'll get the wheel that will serve you best.

GAP LATHES

SIZES 18" to 32"

WITH QUICK CHANGE OR PLAIN GEARING

Besides having great range and adaptability have many special features and points of superiority, among which we might mention:

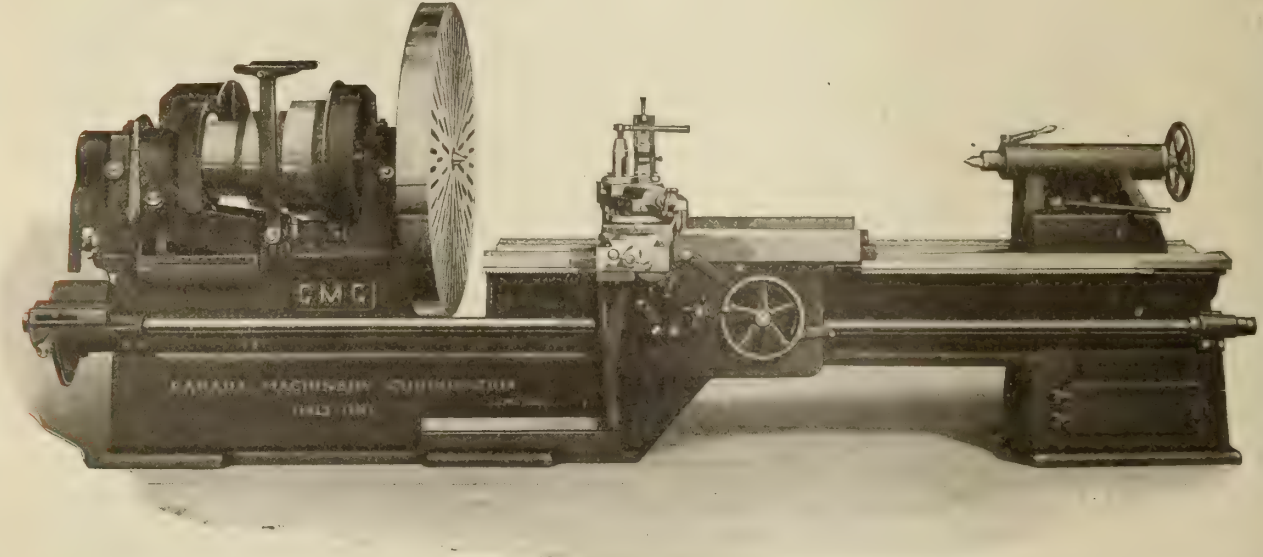
The design of the gap and gap plate is such as to permit the large face plate and narrow work to swing without removal of the plate.

When the plate is removed, jobs of considerable width may be successfully handled.

The bed, especially below the gap, is of unusual weight and strength to insure maximum stiffness under the heaviest cuts.

The headstock is of the three step cone, double back geared type, allowing the use of wide drive belts and giving ample range and number of spindle speeds.

Our improved belt shifter which, besides saving time, forms a safety device, preventing injury to the operator.



32" GAP LATHE WITH QUICK CHANGE GEARS.

Files With A Fifty Year Record

The long life and efficient service that are characteristic of the "Famous Five" Files are the result of half a century of careful investigation and experience. Each file is made from the steel that has absolutely proved it possesses all the qualities that are necessary to the work for which it is intended. This means that "Famous Fives" Files are mechanically perfect—that they save time, labor and produce better results. They get the best work from your mechanics.

"Famous Five" Files are standards of quality in the trade. Specify the ones you want by name:

SMALL TOOLS

P. & W. Threading Tools

Chaser | Single Point | Offset | Double Onset

Uses the same holder for chasers and single point cutters. The change can be made in a jiffy.

A few of its advantages:

Threads can be cut very close to shoulder.

Tools are sharpened by simply grinding off top of cutter.

Combines economy with all features essential in a threading and forming tool.

Cutters have 15 deg. clearance, which experience has taught gives the longest wear in various metals.

LITTLE WORDS WITH BIG MEANING

Quality

According to "Webster," Quality is "an excellence of character; natural superiority."

Service

Webster's definition of "Service" is; "The performance of labor for the benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material. Motto: **"Quality and Service."**

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3¾ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

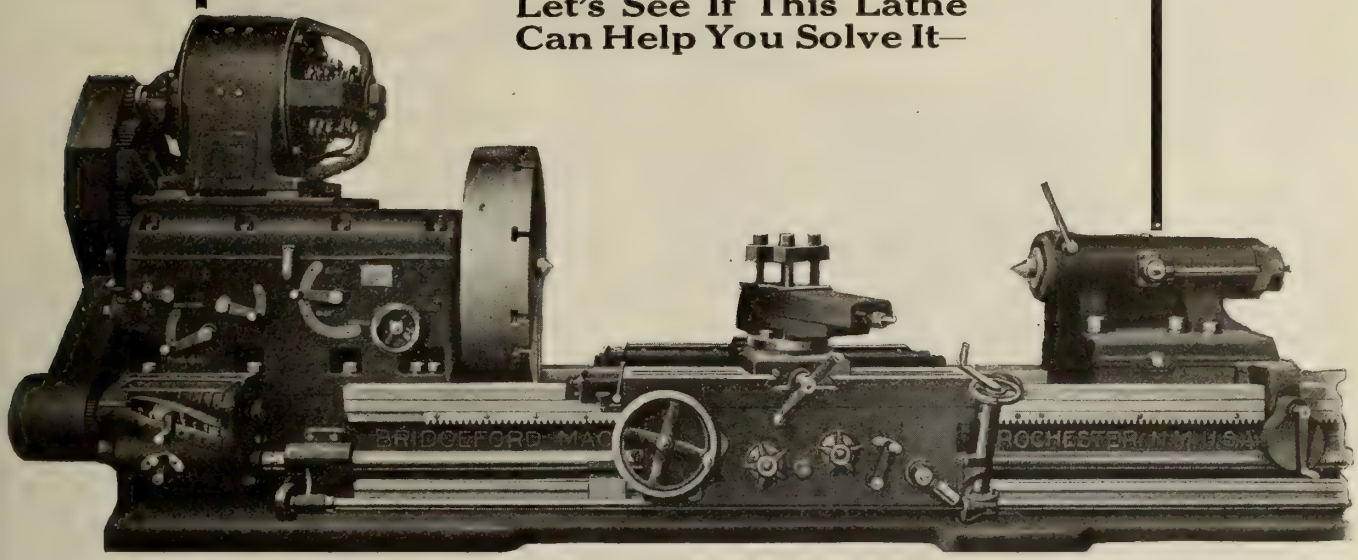
For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

ALGOMA STEEL CORPORATION

SAULT STE. MARIE, ONTARIO

YOUR PROBLEM:

Let's See If This Lathe Can Help You Solve It—



42-inch Geared Head
Heavy Engine Lathe

Its All-Geared Head makes it easy to change the spindle speeds frequently, and consequently effects a big saving in labor and material. The correct speed and feed always are available.

The operator has only to shift a lever on the speed index plate and the speed he wants is there.

Another advantage—the belt speed is constant always. It leaves the field of "single purpose" operations to the simpler machines. It wants the hard jobs.

Bethlehem Steel, Westinghouse, General Electric—these are our customers. You'll find, as they do, that Bridgeford tools are there.

There's a Bridgeford Geared Head Engine Lathe—with swing from 26 in. to 72 in.—to do your hard jobs.

A catalog or a salesman? A request, to-day is best, will bring either.

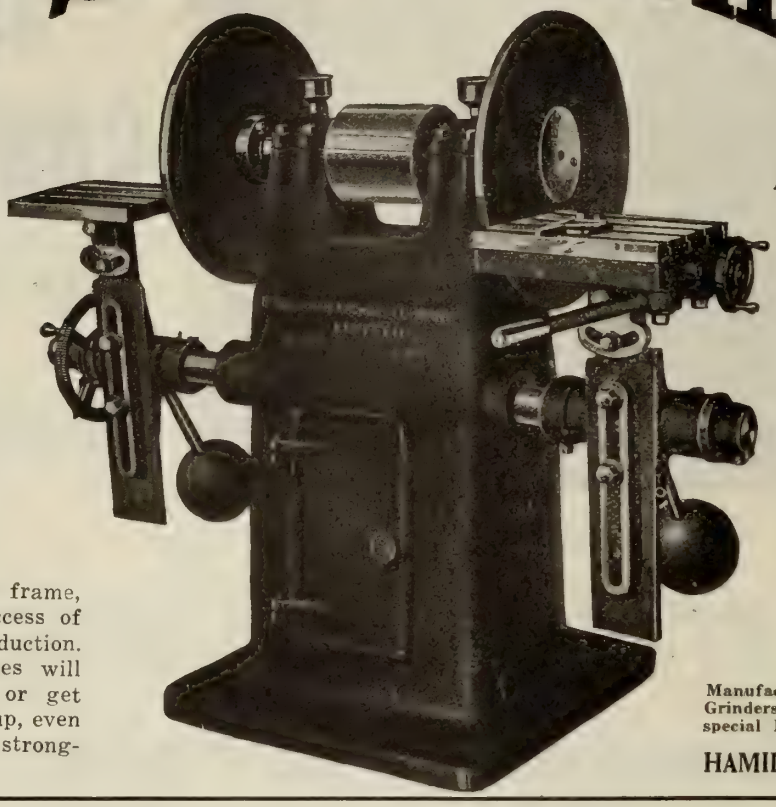
Ford-Smith Grinders

SPEED ACCURACY



The Disc Wheel Grinder (or Ring Wheel Grinder) is indispensable where economical finishing or roughing work is desired.
The abrasive materials on the Disc Circle are to be considered as extra-high-speed cutting tools. This backed by ample belt power, and a heavy rigid frame, is the secret of the success of this method of metal reduction. These improved Machines will not slow down, glaze, or get dull, when correctly set up, even when the work is forced strongly against them.

Illustration shows our 20-in. "Manufacturing" Disc Grinder.

May we send you catalogue, covering full line?

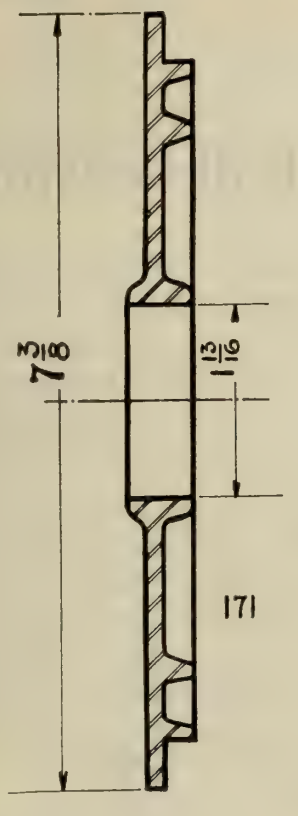
Canadian Manager



To Manufacturers of Electric Lighting And Starting Equipment

Have you ever thought that there may be a better way of machining your castings and forgings than with turret lathes, each of which requires the constant attention of an operator?

There **is** a better way and we are glad to give it to you.

The better way is handling this class of work in POTTER & JOHNSTON MANUFACTURING AUTOMATIC where one operator attends to as many as six machines.

Here is a malleable iron end plate 7⅜ in. in diameter with a 1 13/16 hole. It is finished completely on all surfaces in two chuckings and all done automatically.

Send us your blueprints or samples.

No. 2.

Of a Series of Technical Talks on Ball Bearings

THE upper drawing is an excellent example of an all SKF Ball Bearing lathe head. The drawing, which is a cross section through the headstock of a single purpose lathe, shows the method of mounting the ball bearings. The large radial bearing is locked against a shoulder on the spindle by means of a nut, thus keeping it in position. The housing has two felt washers on the outer end and one on the inner end to prevent chips and dirt from getting into the bearing, and the lubricant from getting out. The cone pulleys are carried on two SKF Radial Bearings held in position by means of a short and long sleeve, and a lock nut. The housing at the right hand of the headstock contains a radial bearing for carrying the spindle and a thrust bearing for taking the entire end thrust on the spindle. It will be noted that the radial bearing is locked against a shoulder on the spindle by a nut. One ring of the thrust bearing is mounted against a shoulder on the spindle while the other, which has a spherical seat and is self-aligning, engages with a steel washer let into the end cap. The back gears are also carried on radial ball bearings.

The smaller drawing on the left hand shows a somewhat similar application to the one described above. It will be noted that in both cases the outer races of all the radial bearings are free to "float;" only the inner races being fixed. The right hand drawing is interesting principally because it shows the mounting of a double thrust bearing in a duplex engine lathe. Note the mounting of the inner race of the radial bearing; the three sleeves and the middle ring of the thrust bearing. These are all locked together rigidly, while the outer race of the radial bearing "floats."

The bottom figure shows an interesting application on a heavy duty spindle. The two radial bearings at the work end of spindle provide great rigidity and eliminate chatter. The cone pulleys are carried on two radial bearings, the larger bearing being held tight against a shoulder on spindle by the long sleeve, at the other end of which is another radial bearing. Both bearings are protected by felt washers. In the housing at the end are two bearings, a radial and a double thrust, the latter taking the entire thrust on the spindle. Sleeves are provided for transmitting the thrust to the thrust bearing and they also lock the bearings securely in position. Lubrication is provided for by means of the grease cups.

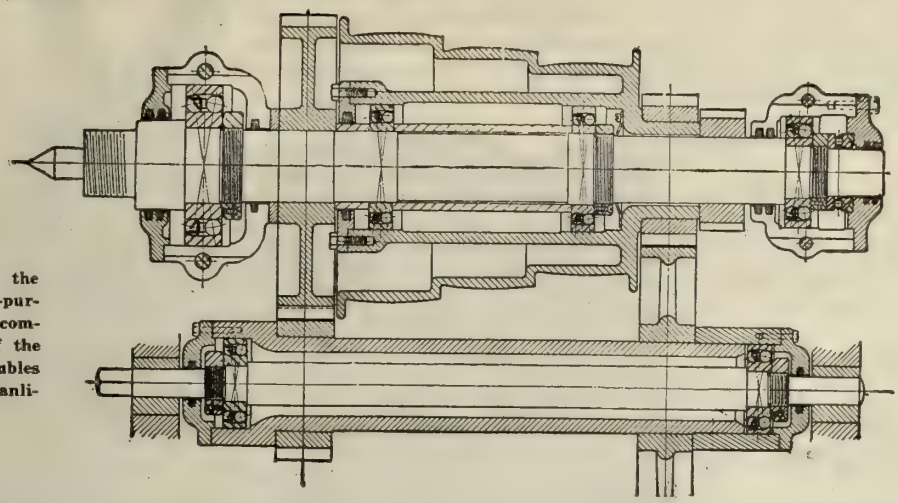
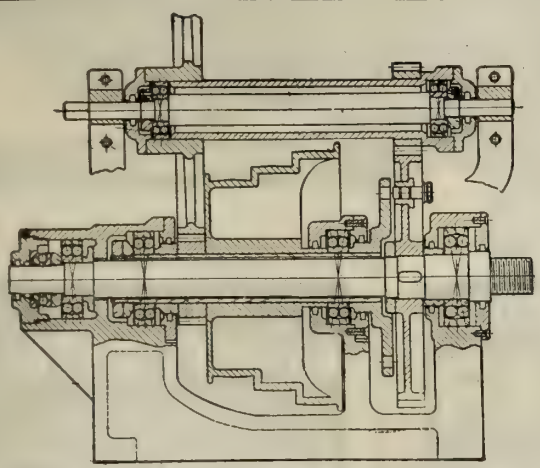
hes

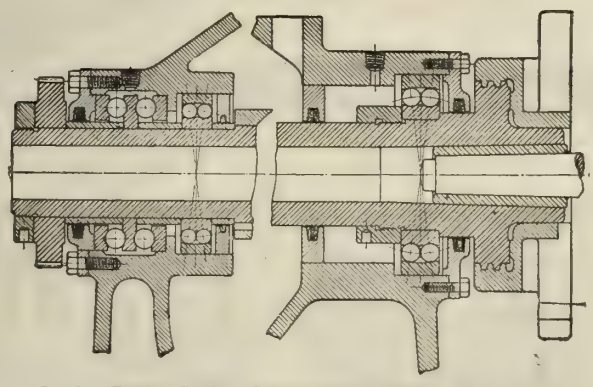
Other S K F mounting suggestions will appear later. We suggest that you clip this page for your file or card index system. Reprints will be furnished if desired. If you are not already receiving them, send us your name and we will put you on our mailing list.



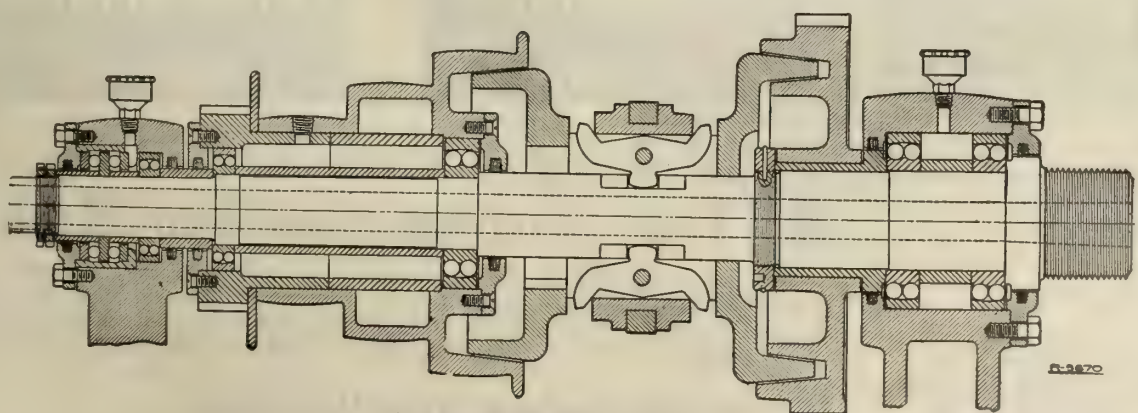
Cross-section through the head-stock of a single-purpose lathe. Note the compactness and rigidity of the design. Lubrication troubles are eliminated and cleanliness assured.



Medium duty lathe, minimum distance between bearing centers assures rigid spindle.



Duplex Engine Lathe—double thrust bearing allows heavy roughing cuts.



A successful heavy duty spindle.
Four rows of balls at work end of spindle provide maximum rigidity and eliminate chatter.

STEEL *for*

Every Commercial Purpose

We are the only company in Canada producing steel ingots by the "HARMET" Liquid Process, a process that makes these ingots vastly superior to the ordinary kind, improving the physical properties and reducing the waste of ingot.

We can supply forgings of all shapes and sizes made of ordinary or "HARMET" Fluid Compressed Open-Hearth Steel on the Shortest Notice.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US

-And I Always Thought That Was A Good Tractor-

Some little part gave way and his Spring plowing was delayed for a couple of days. His good opinion of your tractor is gone forever; others will hear his tale and your distributor in that territory will fall two or three short of selling as many of your tractors as he would have sold if it hadn't been for that defective part, defective because it was improperly heat-treated.

It makes no difference whether you manufacture tractors or other machines or machine parts, unless you have the **right** heat-treating furnace the reputation of your product is in constant jeopardy.

You Cannot Afford to Take Such Chances

GILBERT & BARKER Heat-Treating Furnaces

insure uniform high quality of produce because they are designed right and built right. The combustion in a G. & B. Furnace is 100% efficient, temperature control is one of the big features, the heat is uniform **always**, the result is a finished product of maximum tensile strength which will stand up under the hardest usage.

The operating cost of G. & B. Furnaces is extremely low.

Send for Bulletin 24. Let our Engineers suggest the furnace that is best suited to your requirements.

To-day is a better day than to-morrow—write.

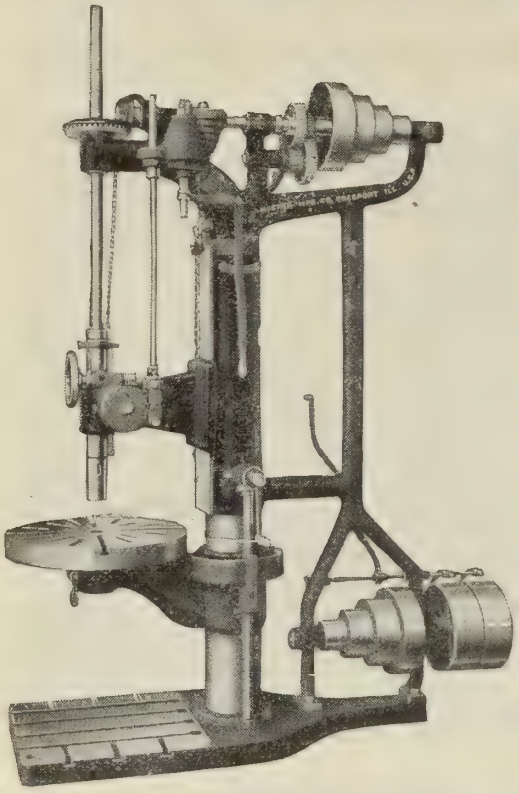
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

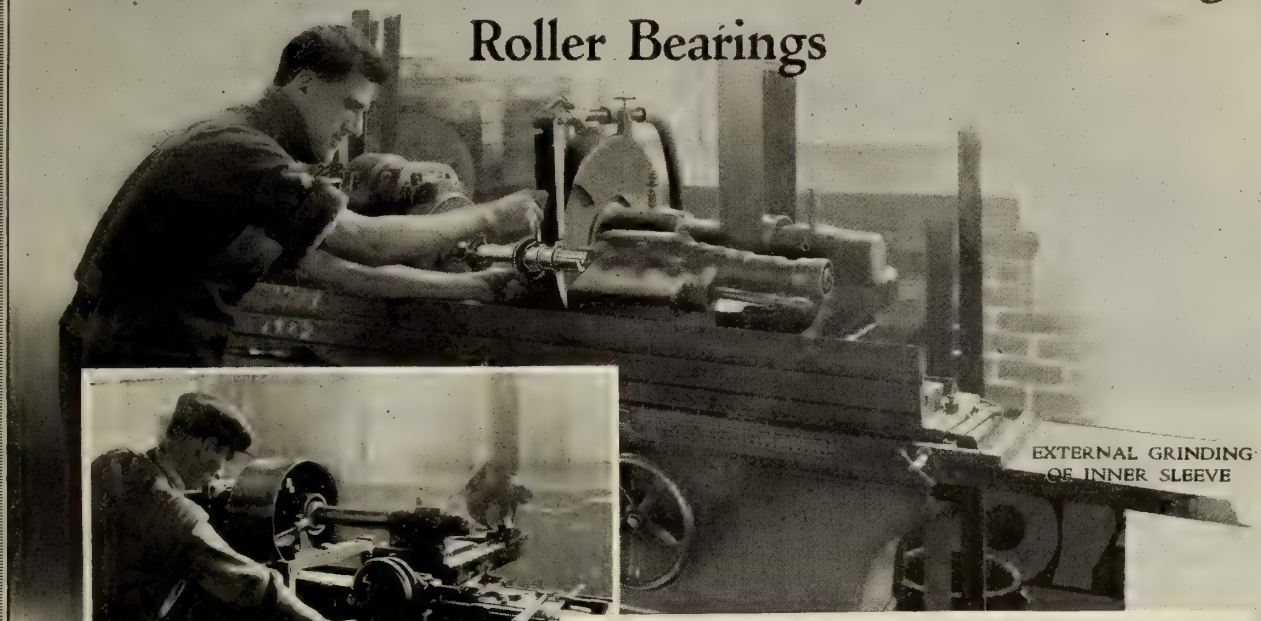
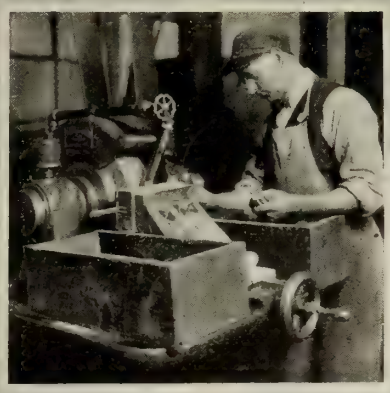
The Part that Aloxite Wheels Play in the Making Roller Bearings

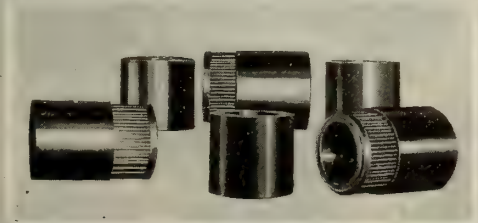


EXTERNAL GRINDING OF INNER SLEEVE

INTERNAL GRINDING OUTER SLEEVE



GRINDING ROLLS



THE FINISHED BEARINGS

THERE are not many precision grinding conditions that put a grinding wheel through such a test as Aloxite Wheels are subjected to in the grinding of roller bearings.

Aloxite Wheels do all of the important grinding jobs —the internal and external grinding of inner and outer sleeves and the grinding of the rolls.

Each job calls for a wheel that must cut clean and fast and cool—a wheel that must hold its shape, and keep free to insure accuracy.

The sleeves are generally of cold-drawn steel, case-hardened. Certain of these sleeve dimensions are held to a total tolerance of .0002".

The rolls as illustrated are of special carbon-chrome analysis, and, after hardening, are ground to a minus tolerance of .0005". No plus tolerance allowed.

Aloxite Grinding Wheels are Performing all of these Operations

They not only meet the exacting conditions, but have increased the grinding production in one plant, 25%.

Carborundum service and a close study of grinding conditions enables us to give

The Right Wheel in the Right Place

Carborundum service is your service

The Hammer With The Human Stroke

HEADS RIVETS COLD

Heads 'em tight or loose, flush, countersunk, or finishes heads any shape desired, and at the rate of:—

A rivet a second, sizes up to 3/16".
A rivet in two seconds, size ¼" to ⅜".
A rivet in three seconds, size 7/16" to ⅝".

And on special order we build machines to handle rivets up to 1½" with proportionate rapidity.

Built in eight sizes.

Besides riveting, the High Speed Riveting Hammer does all kinds of peining, swaging, upsetting, etc.

Send us sample assembly parts with rivets or sketch of your work,

and

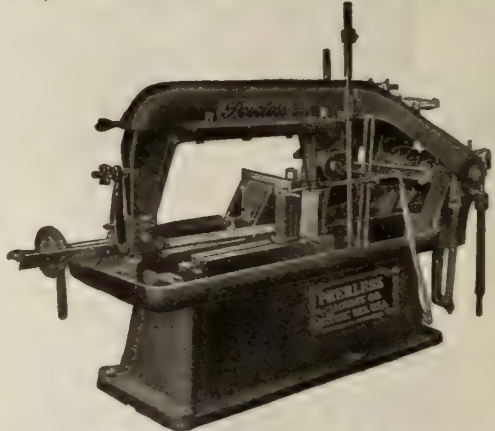
Let us shoulder your riveting problems.
Send for the High Speed Hammer Book.

THE HIGH SPEED HAMMER COMPANY, INC.
ROCHESTER, N.Y.

Would you like to have us prove that

Peerless HIGH SPEED

Machines do 50 to 100% more work



The Peerless has established a new standard of production in so many plants that we are ready to ship one at our expense and risk, if you agree to give it a thorough test. A trial like this often results in our selling from 1 to 10 machines.

The Balance Lift of the Peerless

automatically raises the blade for the return stroke. This greatly prolongs the life of the blades, economizes power, and increases production. There are more good features which we shall be glad to acquaint you with.

The Peerless assures you the peak of production at very lowest cost. Write for full details.

PEERLESS MACHINE CO.

PEXTO STAMINA

(Ability to see things through)

Applied to Pexto Wrenches it is ability to take hold, hang on, come through and stand ready to do the job over and over again.

Each Pexto kind is the same in this respect. Solid Handle, Solid Steel, and Pipe Wrenches are mighty significant terms when associated with Pexto. This name adds a reputation built up through 100 years of tool making. It is surety for long wrench service.

Just as Pexto Tools have played an important role in war so will they prove equally capable in the reconstruction process. Stamina is as necessary is one as in the other.

Every phase of present day activity has need for the ability that is designed and forged into Pexto Tools.

Whether you are buying a hundred tools for the shop or a single wrench for your home you'll find the same genuine economy in Pexto.

Look up the Pexto Dealer in your immediate vicinity.

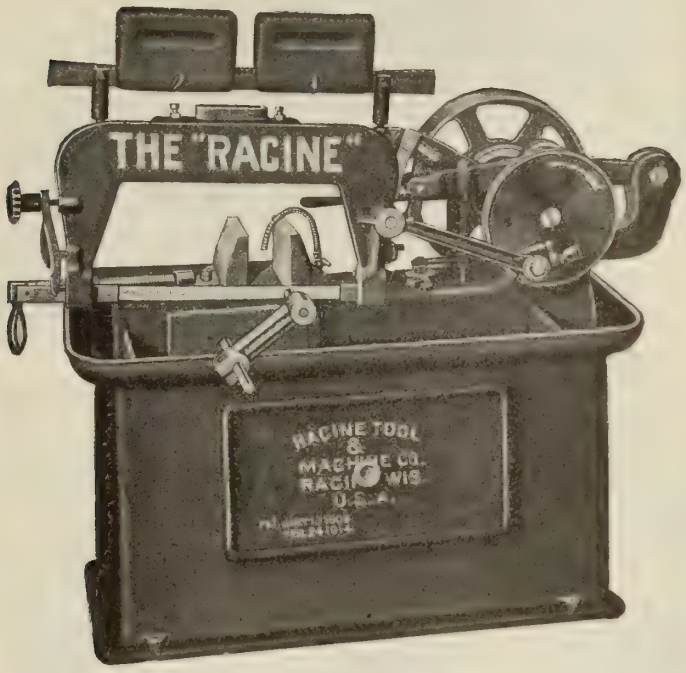
Standard the World Over

"THE RACINE"

HIGH SPEED METAL CUTTING MACHINE



Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

Manufactured by

DIAMOND SAW & STAMPING WORKS, BUFFALO, N.Y., U.S.A.

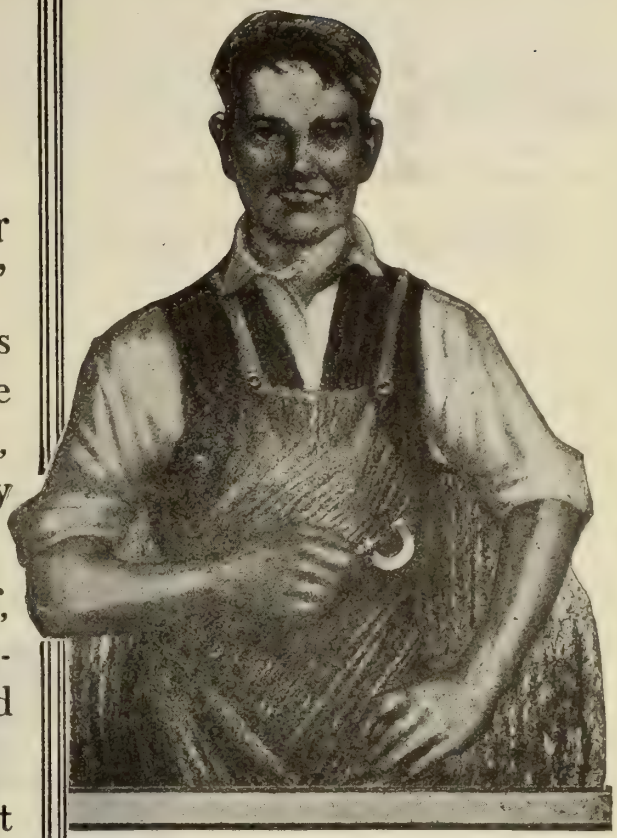
The apprentice says:

"Almost the first tool I ever heard of was a Starrett 'mike.' Somebody pinched Dad's out of his jumper pocket and the fuss he made showed he thought it was *some* tool, even if he had had it close on twenty years.

"When I got into the shop myself, I noticed the toolmakers and everybody who had 'fussy' jobs preferred Starrett Tools.

"There's something about 'em that the fellows like. Yeh! They're accurate and they're convenient, but I guess the fact that the men who make 'em are pretty good mechanics themselves, has something to do with it.

"What? Sure I'm getting me a set of Starrett Tools—I need 'em every day. Yes, I got me one of those seventy-five cent Starrett Apprentice Books, too. It saves me asking the foreman a question every five minutes. Now, when I want to know how to do something, I can look in the book and study it out myself."



The L. S. STARRETT COMPANY

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 69A

Safety with a Norton Floor Stand

Sturdy construction, excellent provision for safety in the equipment of a protection hood, facilities for the attachments of a dust exhaust system and belt protection devices together make the NORTON floor stand a safe and practical machine for the foundry and machine shop.

The operator works with ease, and this enables him to handle heavy work without extra strain. The absence of sharp corners, projecting parts, and recesses where dirt and dust can lodge are further recommendations for this floor stand.

The ideal combination is a NORTON floor stand equipped with ALUNDUM and CRYSTOLON wheels. The choice of wheel depends upon the nature of the work to be ground.

ALUNDUM wheel for materials of high tensile strength—all kinds of steel.

CRYSTOLON wheels for materials of low tensile strength—cast iron, brass, bronze, and aluminum.

Tractor Ploughing Machine of Unique Design

Foodstuffs Are an Absolute Necessity. The Question of Land Cultivation Is Something Worthy of Careful Consideration, and Any Machine Which Reduces Labor Is a Step in the Right Direction.

By J. H. RODGERS, Associate Editor Canadian Machinery

PRODUCTION of foodstuffs in sufficient quantities to satisfy the universal requirements of man and beast, is one of the vital problems of civilization. In normal times, when plenty of labor is available, the question of land cultivation is not surrounded with the difficulties that are only too evident in a time of world crisis, when large numbers of men and women are taken from the productive industries and placed in others where the product turned out is for destruction only. In times like these, and the present is an outstanding example, the strength of a nation depends on its ability to develop, to the utmost, the resources of the country. Cultivation of the land is the fundamental factor of the food problem, and the solution is the extension of the acreage of a food bearing character. Any device that will assist in greater production is essentially beneficial to mankind. With the population of a country tending more and more to crowded districts, it is becoming increasingly difficult to get men on the land in sufficient numbers to maintain the balance for food purposes; therefore, labor saving devices of any description are of the utmost importance.

The accompanying photos and drawings illustrate a novel type of power plough recently designed and constructed by L. A. Desy, civil and mechanical engineer of Montreal, Quebec. Viewed from the near distance it has the appearance of a queer sort of biplane about to take the air, or a mammoth bird with its wings outspread. On closer observation, however, the idea of a flying machine is readily dispelled, as one can immediately see by the construction that the machine is intended for ploughing the ground, and not flying above it. The exact method of operation, at first glance, would be somewhat a puzzle to the uninitiated, but the mechanical mind would at once see and understand the principle upon which it worked, but would be also impressed with the ingenuity of the design and the unique advantages such a machine would have in the cultivation of extensive prairie areas.

Preliminary trials have been successfully carried out by the machine on a farm close to Montreal, and some conception of the work accomplished may be gathered from the photos herewith.

One of the outstanding advantages that is incorporated in this power plough is the fact that a plurality of ploughs can be carried by the tractor, the entire mechanism of the machine being operated by the tractor motor located on the front end of the framework. Another feature of economic interest is the light construction of the various parts, thus assuring high efficiency and low operating costs. Still another factor of interest is the saving of time and labor required to run the plough.

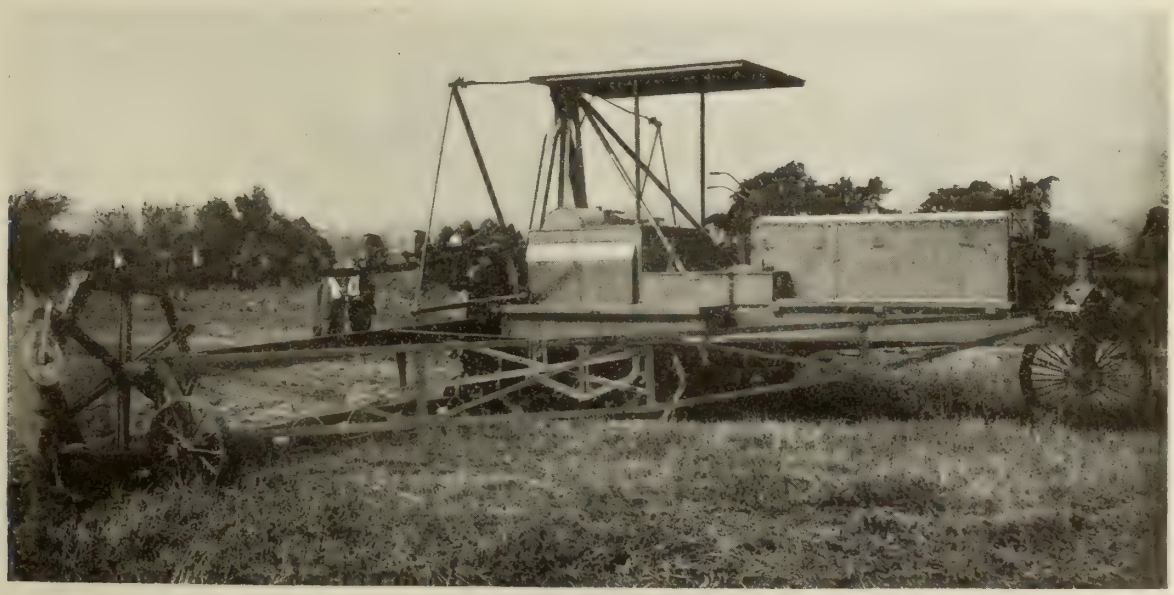

FIG. 1—SIDE VIEW OF THE PLOW SHOWING CATERPILLAR AND FRAME CONSTRUCTION.

FIG. 3—REAR VIEW OF THE PLOW IN OPERATION.

A One-Man Plant

The arrangement of the plough frame and the operating lever is such that the control of the entire machine can be easily manipulated by one experienced man, although it is intended that the engineer in charge will have the aid of an assistant.

That a better idea of the construction and operation may be had, the following brief description is given. The frame of the machine proper is made of light steel channels and angle irons, and steel castings, the latter being largely made on the box pattern, to give strength with ligtness. The line drawings shown herewith are to scale, but accuracy of detail in general assemblies has been dispensed with, the various views being sufficiently clear for descriptive purposes.

In the different views the same parts are indicated by the same reference letters and figures. It will be seen that the power from the engine A is transmitted through the drive shaft B, and the different gears and clutches, to the various shafts for operating purposes. The main shaft C carries the friction discs D.D, and the sliding gears E that provide two different speeds for the caterpillar tractors. These gears may also be located in a neutral position so that elevation of the plough frames, or the lateral movement of the plough shears, may be obtained independent of the advance movement of the tractor.

The forward motion of the machine is obtained by engaging the gears E with either gear F or G, which are keyed to

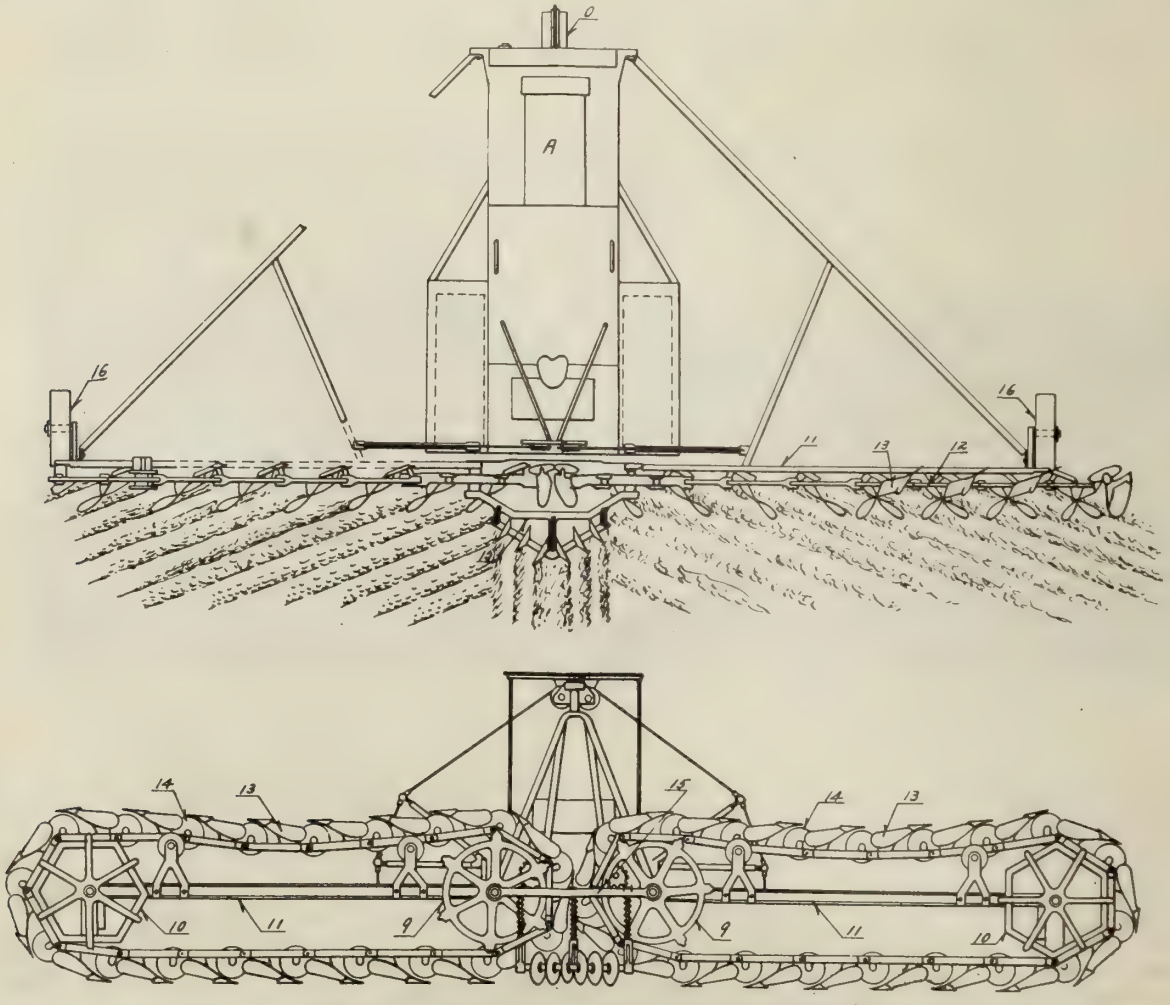

FIG. 2—PLAN AND REAR VIEW OF THE MACHINE.

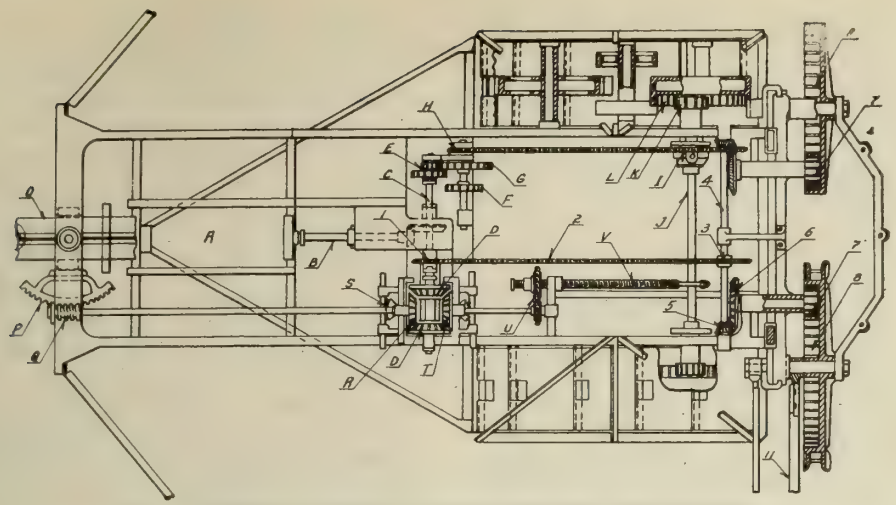

FIG. 4—GENERAL VIEW OF THE OPERATING MECHANISM.

the small countershaft, the small sprocket H being secured at the outer end. By means of a Baldwin chain the power is transmitted to the large sprocket I, that is fastened to the shaft J, that carries the pinion K, K, which in turn mesh with the large gears L, L, on the internal periphery of the hexagon sprocket M, that engages in slots at the joints of the caterpillar treads. These latter are made of sheet steel and wood centres. Small idlers, N, are used to support the centre of the treads. A guide wheel, O, is pivoted at the front of the machine for steering and turning purposes. On the vertical axis is the quadrant P, meshing with the worm Q, driven by the shaft shown, and disc R, this being engaged with the discs D, D, by means of a lever at the front of the operator, which operates the rack and quadrant S, and a cam enclosed in the housing of the shaft bracket.

Raising or lowering of the plough frames (both of which act in unison), is obtained by the movement of another lever in front of the driver's seat. These various control levers can be clearly seen in the illustrations. By engaging the disc T, which is accomplished similar to the forward one, the power is transmitted through the chain drive U, to the long threaded shaft V. To the rear end

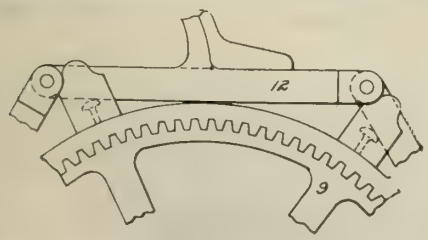

FIG. 6—DETAIL VIEW OF DRIVING SUPPORTS

of this shaft is secured two cables (one for each arm), that pass over pulleys located at the rear of the machine frame. The outer end of this cable is fastened to the upper end of a triangular frame W, one of these being located at either side of the machine. From the outer end of each triangle the plough frame is suspended when raising or lowering it into position, and at such a point that the weight of the frame, ploughs and supporting links, are practically balanced. The frames lift vertically for about one foot and then the outer ends are raised still further while the inner ends remain stationary.

Operating Plough Shears

The unique feature of the machine, however, is arrangement of the plough shears and the method of operation. The principle is somewhat similar to the cutting of a spiral on the milling machine. Here again the initial drive commences at the main shaft C, starting with the sprocket I, the chain 2 driving the sprocket 3 and the shaft 4, each end of the latter carrying the small bevel pinion 5, engaging with the large bevel gears 6, to provide a right angle drive. The pinion 7, on the rear end of the shaft, engages with the internal gear 8, which is integral with the large sprocket 9. A similar but lighter sprocket 10, is carried on the outer end of each frame 11. Over these sprockets travels an endless series of nineteen hollow cast steel links 12, each one of which carries a plough shear 13. Forged plough points are provided for each. A swivel bracket and small stub shaft are also provided on the forward end of each link, for mounting a disc-furrower 14. This disc may be placed at the desired angle with the plough shear.

The plough "chain" is driven by means of lugs on the outer periphery of the central or driving sprockets 9, these lugs being of the forged variety to guide the chain in its passage round the sprockets. The sprockets on either side are staggered so that interference of the plough shears will not take place. Owing to the method of operation, a portion of the ground in the centre cannot be ploughed by the revolving process. To provided for this a large hollow cast steel brace 15, is secured at the rear, between the large sprockets. Hanging from this support are three small brackets that carry two small shafts set at an angle, on which are six disc ploughs. This hanging support is provided with adjustable tension springs as shown. It might be well to mention that the pinion that drives the large sprockets 9, 9,

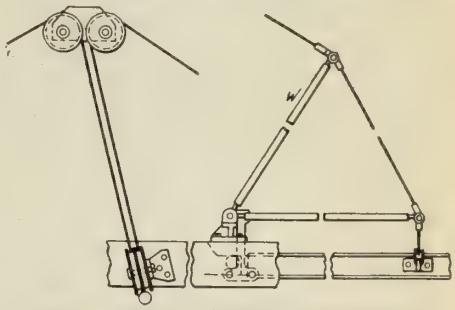

FIG. 7—DETAIL VIEW OF ELEVATING MECHANISM.

is located sufficiently above the centre to permit the elevation of the plough frames the required distance from their lowest position. Several enlarged parts of different details are shown in Figs.

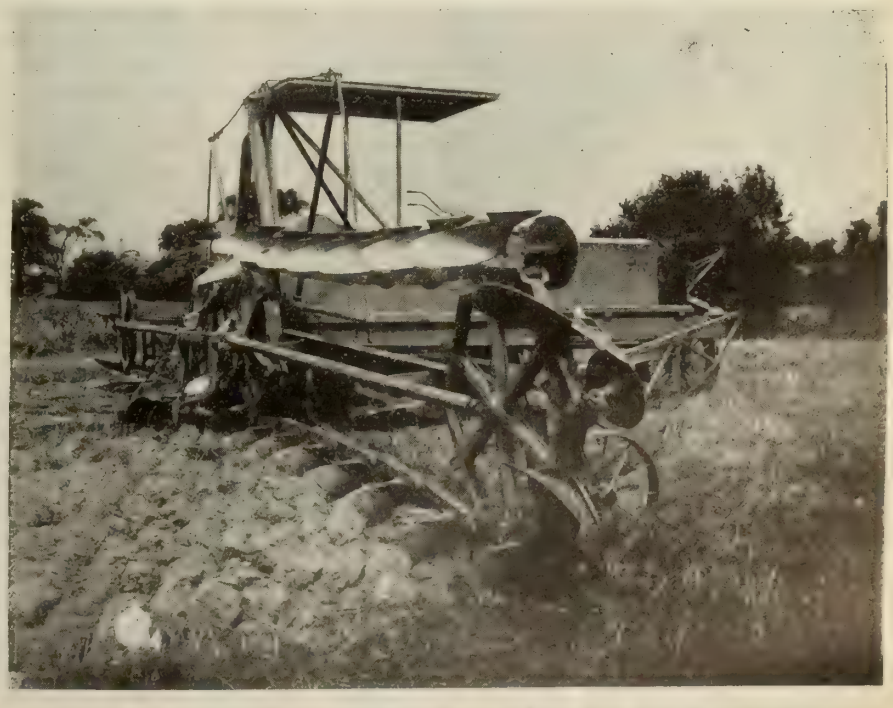

FIG. 5—CLOSE UP REAR VIEW OF THE PLOW SHOWING THE DETAILS OF THE PLOW FRAMES AND FURROWS.

6, 7, 8, that give a clearer idea of the construction.

A guide wheel, 16, is provided at the outer end of the plough arms, suitably supported from brackets that are se-

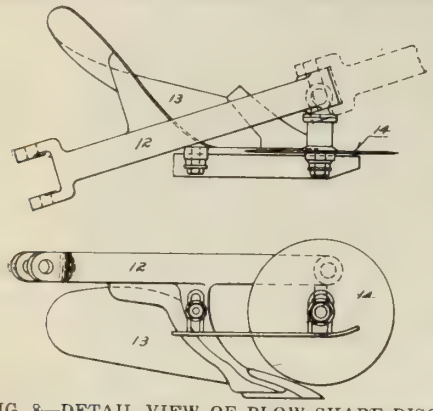

FIG. 8—DETAIL VIEW OF PLOW SHARE DISC AND CHAIN LINK.

cured to the central channel irons. A further brace, composed of a pipe of ample dimensions, extends the full length of each arm, and acts as a stiffening member. It will likewise be noted in Figs. 1 and 2, the light tension member, made of angle iron, that extends from the front portion of the frame to the outer end of the plough arms. On the cut, showing the side view of the machine, can be seen the guiding points, located at the top of the front wheel shaft. This indicator provides an easy method for the operator to tell at a glance the relative position of the steering wheel, and aids him in maintaining a straight course on each and every trip.

In coming to the end of a field the plough arms are elevated, and by operating the steering wheel in conjunction with the caterpillar tractors, the machine can be swung around in its own length, so as to bring the plough in the proper position for the return trip. If desired, the entire machine can be backed up to the very end of the field and ploughing started, thus leaving little or no waste land. The field, after ploughing, will have a herring-bone effect, owing to the angular movement of the plough shears, as the combined forward travel of the tractor and the lateral movement of the plough chain, give a furrow that lies at an angle of about 20 degrees with the field travel of the machine, the furrows being approximately nine inches in width.

The entire machine with all necessary equipment has an approximate weight of about eight tons, and it is estimated that upwards of 10 acres can be ploughed in less than 10 hours. The test, however, was made on land that had not been ploughed in three years, and as this machine is primarily intended for Western farming, where extensive cultivation is continually carried on, the estimated amount of work that may be performed may be materially increased.

DRAUGHTSMEN'S ASSOCIATION

IT is not, perhaps, generally known that there is in Canada an organized Draughtsmen's Association with headquarters in Toronto.

This society was organized on May 16, and on the second and fourth Friday of each month hold regular meetings in the Sons of England Hall at 6.30 p.m.

We understand that the main objects of this association are to promote the economical and intellectual welfare of the class to encourage intercourse between all draughtsmen, to facilitate the acquirement and interchange of professional knowledge among the members, also to bring about a better understanding between employers and employees, and to procure the means of securing employment and supplying help. The president of the association is Mr. Geo. H. Rix, of the Canadian National Railways; the secretary is Mr. Arthur E. Fetherstonhaugh, architect, 224 Kingswood Road, Toronto, to whom all communications should be addressed.

There has recently appeared on the streets of London an ingenious little vehicle which is popularly called the Tankateen. It is a three-wheeled vehicle, taking its general design partly from the conventional motorcycle and partly from the small automobile. It has a three-horse-power motor, which is ample to carry the load imposed by this miniature car. All in all, the Tankateen is an inexpensive vehicle to buy and to maintain, yet it meets the demands of those who prefer something less strenuous than the motorcycle.

A metal lighter than any yet known, and as strong as or stronger than steel, has for years been the dream of many, and every now and then rumors are circulated to the effect that at last it has been discovered. The advantages which such a metal would have, especially for aircraft, are obvious, but unfortunately it is generally found on investigation that there is a "snag" somewhere. The latest report to be circulated relates to a new magnesium alloy, said to have been discovered by a metal company of Montreal, Canada. The new alloy, it is stated, is only two-thirds the weight of aluminum and is "as strong as steel." It is said to be especially suitable for pistons and connecting rods of aero and motor car engines. It is to be hoped that some of the qualities attributed to the new alloy may, on closer examination, be substantiated.

Silicon exhibits the highest known thermo-electric power. It is a curious fact that silicon is either strongly electro-positive with respect to copper or electro-negative, according to the method of preparation, and by combining the positive and negative varieties thus obtained, we can construct a thermo-electric couple displaying the enormous differences of potential of 1,000 microvolts per degree centigrade. The small quantities of impurities, such as iron, which are always found in silicon, diminish the thermo-electric power without, however, changing its sign. By crystallizing the silicon in aluminum to purify it, we obtain a strongly positive product; by crystallizing it in silver or in tin, in each of which it is less soluble, we arrive eventually at an electro-negative product.

Experiments with Germanium demonstrate that this body presents the highest thermo-electric power next to silicon. These two substances also resemble each other in other respects, in particular, in their remarkable power of rectification with respect to the Hertzian oscillations.

FIG. 9—REAR VIEW OF THE PLOW WITH THE PLOW FRAMES ELEVATED TO ALLOW THE MACHINE TO TURN FOR THE NEXT TRIP.

Canadian Machinery Drafting Course Review

Now That the Summer Is Over, There Is No Reason Why We Cannot Once More Settle Down to Work on This Course. For the Benefit of New Readers We Make This Lesson One of General Review.

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE entering on the actual review lesson we will relate for the benefit of the readers how the idea of the course originated.

The writer, himself a slave of the board, suggested that the readers of CANADIAN MACHINERY should be given, through the medium of our columns, a series of lessons on the art of mechanical drawing.

The suggestion was immediately adopted, although such a proposition was entirely new and had never before been attempted in the form in which we now proposed tackling it, namely, to have the students send their work in for judging, and award to the three best efforts sent in each lesson a suitable prize.

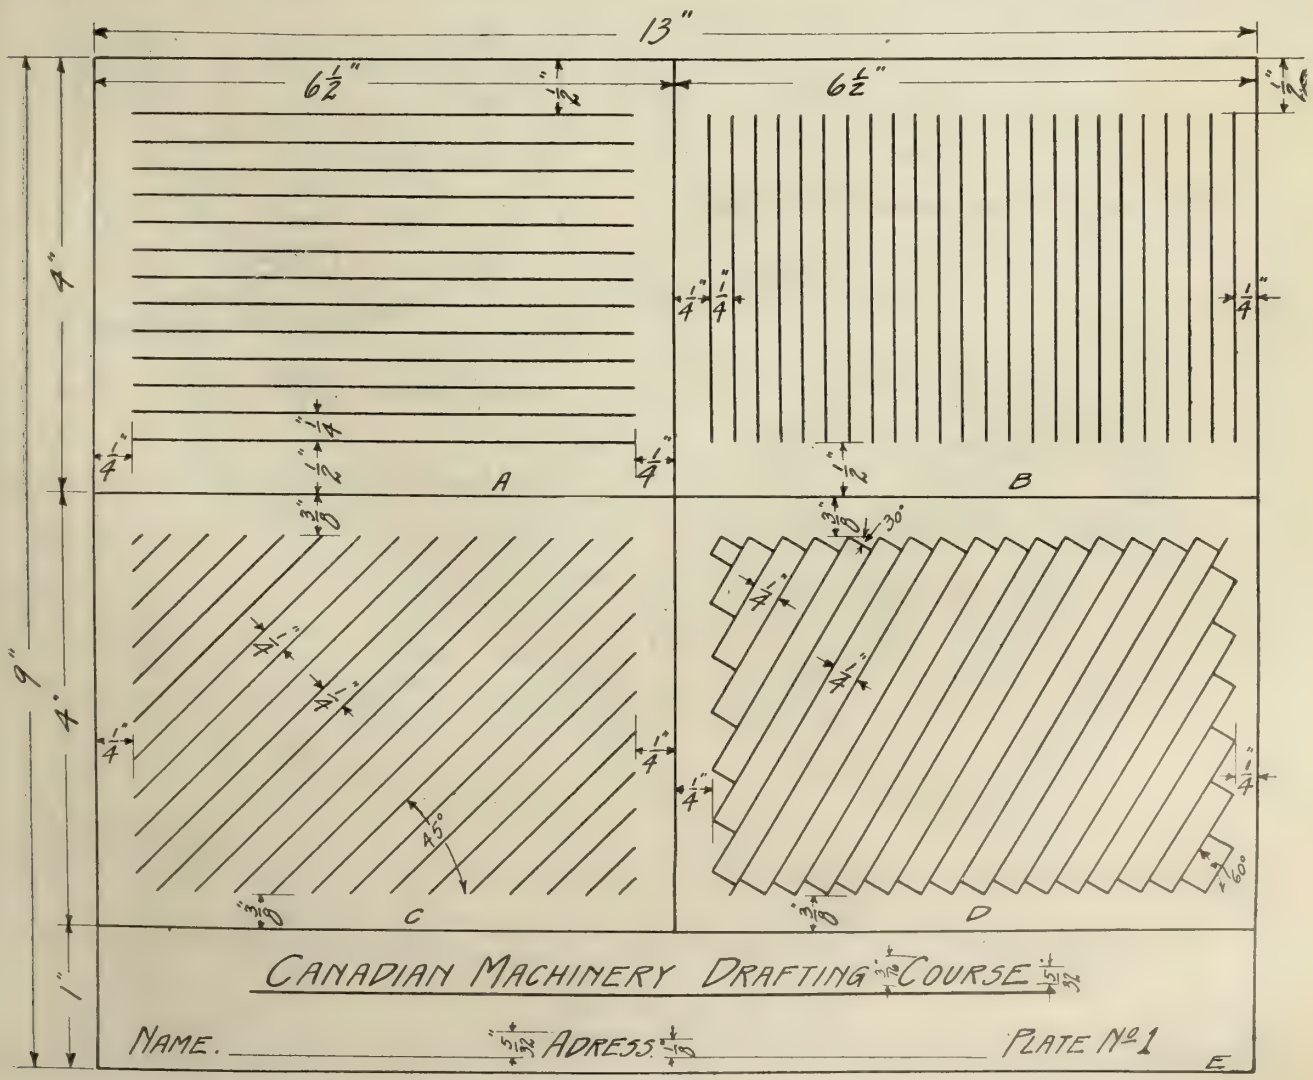
The idea took hold from the very start and the readers of CANADIAN MACHINERY were wise enough to realize that they had here an opportunity to secure a series of study lessons at practically no cost, which if secured through any other channel, would entail a considerable outlay.

Naturally, this is a source of considerable gratification to us, seeing that we have gone to considerable expense in preparing this series. So great, in fact, has been the demand for back copies of the course, that we have been obliged to issue reprints in order to comply with these requests.

Each part has been reprinted separately so that our readers may secure any part desired simply for the asking.

To those who have not yet started the course we can only say: "There is no time like the present." If you require them, we will send you the seven parts already published without any charge whatever.

As evidence of the universal interest taken in this series, we have only to mention that we have plates coming in from all over the country. We have received them from points situated from coast to coast in Canada, and even Uncle Sam's domain is interested in our attempt at providing the apprentice and tradesman with a practical study of mechanical drawing. The states of Connecticut and Illinois have so far been represented. The Grand Trunk Railway Co. have a splendid system of training for their apprentices, and they have seen fit to adopt these lessons as a help to their students. We have already enrolled over one hundred of these boys on our list. We have no doubt that other firms will also see the advantage of interesting their apprentices in the series. The apprentice of to-day is the tradesman of to-morrow, and the add-



ed education which the apprentice is bound to assimilate will eventually come back in some form or other to the manufacturer himself as well as help the student to increase his earning power.

So a word to the wise. If you are already a student stick to the work you have taken up and follow these lessons faithfully. If you are not a student, be one NOW. We have not yet gone very far in these studies, and by securing reprints you will soon catch up—or, if you prefer, start right in at this point and follow on.

Having given this short resume of the history of our course, we will now start in on the review lesson proper.

At the commencement of our lessons we promised to touch only on the essential points of our subject, and as far as possible we have followed out this province.

Review of Part 1

In Part 1 we defined mechanical drawing as the method of showing graphically the intricate details of machinery. We said that it was, so to speak, the language by which the draftsman speaks to the workman. We impressed upon the reader the necessity of making a neat drawing, for a careful draftsman never made a poor drawing.

We touched on the question of paper, and mentioned that a grade of cold pressed drawing paper would effectually serve our purpose. The subject of sharpening the drawing pencil was discussed and illustrated, a chisel point being designated as the proper point to be used. The drawing board, T-square, triangles, etc., were all discussed, and their uses were fully explained. To conclude Part 1 we instructed the student to prepare Plate No. 1, which we reproduce in the present lesson, for our new readers' benefit. We will, in fact, show all these former plates, so that new readers who do not wish to study all the former parts in reprint form, can at a glance see the ground we have already covered. It would be a splendid plan for these new students to draw up these former seven plates for practice. Practice, we are told, makes perfect.

Of course, it is unnecessary to send in these plates from 1 to 7, but commencing with our next lesson on plate No. 8 we hope to see your work.

Review of Part 2

In Part 2 we went still further into the use of the drawing instruments, including the scale, French curve protractor, and regular typical set of instruments. We also discussed some triangle problems, and the fact that lines dif-

PLATE No. 6.

fered in style and representation. We referred to the full line, the dimension line, the dotted or hidden line, and the construction line. We also took up the question of finish marks and their proper function.

We then reproduced Plate No. 2, and requested that this plate be inked in with a good brand of India ink. Higgins' ink was suggested as being about ideal for this purpose. Plate No. 2 is also given in this lesson, and is well worth drawing up.

Review of Part 3

In Part 3 we started with a friendly warning to the student in general. "Do not yield to the inclination for speed only, but be content to travel the road carefully and at a natural gait" was our suggestion. We issue this warning not to quell any impatience which might arise in the student when he saw Plate No. 3, and read the lesson of the same number, for the complete portion was devoted to lettering and section lining. We felt that students might say: "Oh, what's the use of all this"—but you cannot make a neat drawing without neat lettering, therefore, lettering is essential, and to know by looking at a sectional view the materials represented you must first know how the various materials are represented. We see, therefore, that not only is lettering necessary, but section lining must also be a part of the study, from which it will be seen that we were touching on the essential points only. New readers cannot do better than secure a reprint of this portion, for it is impossible in a review of this nature to give all details. Plate No. 3 illustrates how the work embodied in this part was finally arranged. The lettering below this plate read as follows: "CANADIAN MACHINERY" (in block letters), then followed "CANADIAN MACHINERY has a motto well worth while. To make their paper better this week than last week, advancing all the while. The price is $3.00 per year. Let us have your subscription now." By this means, we gave students practice in their lettering, and at the same time, impressed on them the fact that CANADIAN MACHINERY was honestly endeavoring to please its readers.

Review of Part 4

On starting Part No. 4, we urged upon readers the necessity of securing a good groundwork in geometrical drawing.

We promised, however, that only three plates on this subject would be dealt with, and that only the most important and practical geometrical problems would be considered. We then went into geometrical definitions from a point right up by stages to the questions of angles. We next gave instructions for Plate No. 4, which is shown in this review lesson and is well worth following up.

Review of Part 5

In Part 5 we went still further into the subject of geometrical terms and their meaning, leaving the angles and going into surfaces and plane figures. The various polygons were taken in turn, triangles of all kinds the parallelogram, the rectangle, the square, the rhombus, and the trapezoid. From this we went on to plate No. 5, which we have reproduced.

Review of Part 6

In the third and last portion of geometrical drawing, namely, Part 6, we entered upon the subject of circles and solids. All the various definitions were gone into. The diameter, radius, tangent, chord, secant, area, segment, sector, inscribed angle, concentric circles and eccentric circles were all discussed. The measurement of angles was also investigated.

The cylinder, cone, sphere and ellipse were later explained.

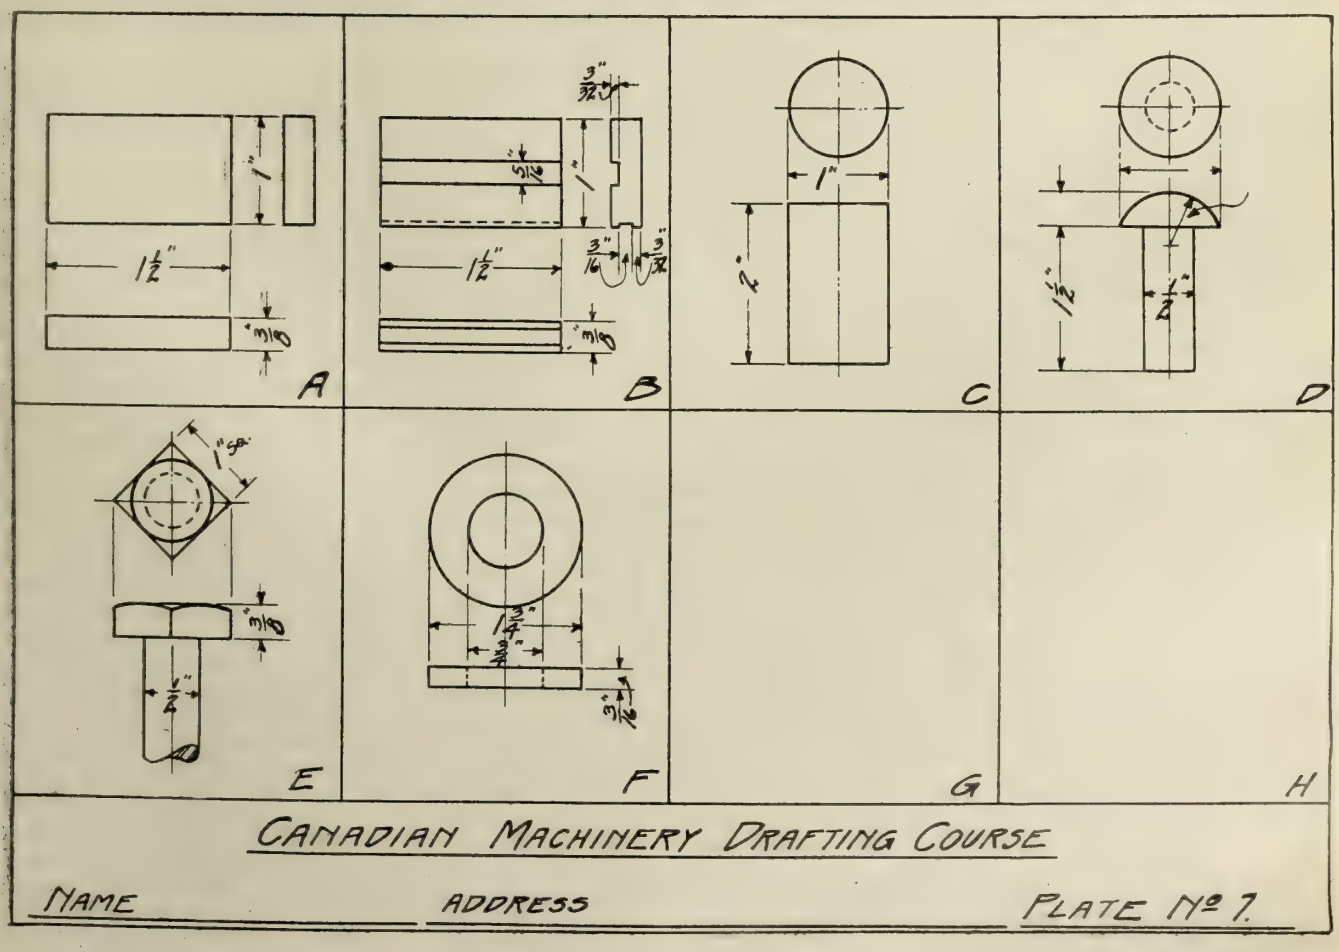
We then went on to Plate No. 6, which will be again found in this lesson.

Review of Part 5

We entered a new field in this part, namely, the subject of orthographic projection. In order to make the same interesting to the student in general, we used (as far as possible) objects with which the student was familiar. A clamp, was first shown as it would appear to the eye, then as it would be drawn mechanically. We next showed an angle plate as it would appear to the eye, and we again placed before readers the mechanical drawing of this piece.

We next portrayed a chart of eight pieces, as these pieces looked to the eye, each piece being familiar to the apprentice of the drawing office, or shop, and on Plate No. 7 we placed, mechanically,

(Continued on page 303)



Some Chatter from the Pneumatic Drill Motor

By JOHN O. HOPE

I AM the Hill Drill Motor, and following the route of my predecessors, I was one day shipped in company with some of my respective brothers to a large plant in N. H. I felt assured that I was pretty badly wanted at this destination, for I had heard that there had been some hold up, in jockeying with the requisition and invoice papers in connection with my delivery, which was every day delaying and also making a great deal of hard feeling with reference to a large machinery contract which was promised under certain contract date delivery.

We were taking some pride in assuming that our motor family, including myself, were so chiefly concerned, and were to be so much depended upon to help out on this most important contract.

On arrival at my destination in N. H. I was duly passed through the receiving office, then taken out of my travelling costume, so to speak, and put on a tool rack in the stores, where after a very brief rest, I was taken from this department and brought into a large machine plant.

The familiar mechanical working sounds which greeted my ears on entering this plant made me feel that I had found a home somewhat similar in most respects to the one I had previously graduated from.

I was straightway introduced and handed to my friend Driller (as I shall call him), an easy going, none too particular, so you could notice it individual, who was told to take great care of me, with a reminder from his foreman, that he did not want to hear any more complaint about (That Old Motor), as such stuff would not be swallowed in the near future, or for some time to come.

My friend Driller, who was now to be my very intimate friend or enemy in the days to come, stood me up on end and pivoted me around on my handle end with a few expressive grunts, which at this present time gave me no cue to determine whether they were grunts of satisfaction or disapproval. Other casual observances of my exterior being concluded, he accidentally let me slip from his hand which brought my body in hard contact with the cement floor, which accident gave me a bodily twinge that made me feel that a few repeated occurrences of this nature would make me fall into a decline (not as yet indicated).

My friend Driller, as I will still call him, picked me up apologetically and murmured something about the paint, which I presume was my exterior finish or coat of respectability which all the pneumatic motor family possesses.

He now swung me up on his shoulder and made a casual remark to another Driller brother, who was pulling a poor dilapidated looking cousin of mine across the floor towards him by the air conveyance known as the pneumatic or motor hose, that he would have to take me to the Motor Trouble Man and see that I was O.K. in my lubricated parts.

The repair man looked me over and expressed his opinion that my home people had probably attended to this most important need before I was shipped, but to make doubly sure he proceeded to pour a liberal amount of their oily substance into my working parts, remarking that it would do me no harm.

This measure of thoughtfulness gave me an uneasy feeling, that I was very much physicked, and that there would be a resultant observance in connection with this in the very near future.

My still best intentioned friend Driller now picked me up once more and brought me to the scene of labor, where he and myself were to thresh out our life's difference in the interest of the N. H. plant's demand.

He now procured a length of pneumatic hose, and connected one end, which had a very indifferent thread connection, to my throat, which when coupled to the main air line connection left me ready for service; meanwhile, I heard him remark that the hose was not up to much, and that some of those wise guys would be around presently to give him what for, and make him believe that he was using up all the air in the plant, and from my distant location I could judge by the sound of escape air that our initial start off would not be altogether amicable.

My thoughtless friend the Driller, as I will now have to designate him, proceeded to open up the main air valve, which caused an accumulation of dirty brown water to rush down my throat and enter into my lungs, which completely choked me up, and being in an oil-doctored condition, as before mentioned, it took some time to get this dose out of my system, which when attended to, made me experience a feeling of being washy and very dirty in my vital organs, and with acute signs of indigestion if any more of the same proceedings was to be renewed.

My now distrusted Driller proceeded to insert a machine drill into my main connection provided for this purpose and not feeling quite satisfied that he had made the drill secure enough into me, which was of tapered shank variety, he, to my astonishment, picked up a hand hammer and gave the drill a sharp blow on the extreme point, which gave my inside an unpleasant jolt and he then seemed concerned only to notice that he had not damaged the cutting edge of the drill, and to murmur a blessing on himself that he did not get the sliver of steel in his eye which he was industriously picking out of his hand with a pin.

I was now placed in a very favorable position which I could see at a glance was going to enable me to demonstrate my superiority by drilling a straight depth hole of 6-in. thickness of metal.

When the air was released to start me on my anticipated labor, I could tell right away quick that my poor friend the hose was in a very sickly condition and was not capable of delivering the proportionate amount of air to my lungs that I could feel was necessary to make me produce the goods.

My now cranky friend the Driller passed not a few unsavory remarks about my anatomy in general and at the same time released the drilling pressure on me to such an extent that I fairly ran mad, so to speak, but making very slow progress in getting through the 6-in. deep hole which I was drilling.

Eventually, by spasmodic stopping and starting pressures exerted on me at an uneven application of the feed screw situated on my top-knot we managed to struggle through this particular job, which when concluded I was unceremoniously banged down on the floor.

Oh, if I could only have made my cranky friend the Driller understand, that to have fixed up poor friend hose would have been a blessing, and that giving me the full power and pressure of air, which was my principal and essential need, I then could have kept right on running at a normal speed which would have controlled me by a steady feed, relative to constant cutting, which would have let me perform a quick service and saved a couple of thousand cubic feet of free air which was racking my inside by the uneven work which I was asked to perform.

I will now have to start in and lose any or all respect that I might have entertained for my meanwhile friend Driller, for now that he was obliged to change the drill for a smaller size, he deliberately took a hand hammer and, after having taken a cautious look around (probably

with respect to my new condition and slight momentary compassion for me) he hit me several sharp blows on the part surrounding the entrance to where present drill was driven into my body previously described, and when this did not release the drill he deliberately placed the sharp edge of a cold chisel on the drill as close to my body as he possibly could and gave a couple of good, hard blows which made an indent in the drill shank, another in the chisel and produced a great, heart-breaking drag to my inside works.

The balance of this day's work was a constant repetition of the above-mentioned performance, and at quitting time I was bundled into a cupboard amongst a miscellaneous assortment of old fittings, etc., where I was perforce obliged to gobble any or all of the dirt and dust that came in my way.

On the following morning I was not at all surprised when my enemy the Driller, as I must now designate him, lugged me out and started me on my day's labor, and for several days at a time, never giving me a thought that I was perishing for a good lubricant bath to oil my working parts, and you would have sat up to take notice of the way he hauled me around in the days that followed.

My fate was similar to that which I have seen handed out to most of my family connections. It is then you could understand that after being in the repair doctor's hands several times for bad external sprains and internal seizures that the life had fairly been dragged out of me and I could not help but think that the only consideration that probably saves and manages to keep our family reputation up is due to the fact that not all Drillers are our enemies and that we can still rub shoulders with a great number of our good friend Drillers who know the treatment we deserve.

ECONOMIES AND COUNTING

By F. E. MERRIMAM

ONE of the greatest differences between ancient and modern methods of manufacturing is the greatly increased use of machinery at the present time. In olden times machines were few, frequently inefficient and always expensive. By contrast, labor was plentiful, cheap and could quickly become reasonably efficient. In fact the manufacturing methods of the various nations of the world now differ along much the same lines. The progress of industry has been marked by a reversal of these conditions, which is continually becoming more complete.

One of the most common operations in any factory is that of counting goods in at all stages of completion, as well as purchased material. This is such an everyday, commonplace operation that not infrequently its expense is unnoticed and the means of reducing it quite neglected. Undoubtedly, if the total cost of counting goods in any factory were accurately determined, the management would be tremendously surprised. The largest factories, of course, carry the greatest expense, yet even the smallest have a considerable bill. It is a strange commentary that frequently an exceedingly small factory office will boast an adding machine, while its much larger factory has no better method of computing its output than the "One, two, three, four" method. Quite reliable if the counter can keep his mind on it and is not disturbed; but subject to many and often indeterminate errors. It has also the disadvantage of not possessing much capacity for increasing the quantity of goods handled.

Obviously the answer to the counting problem is a quick and accurate mechanical device. There are such machines on the market which fulfil these requirements, as well as that of reasonable durability and a low maintenance expense. To the average manufacturer who does not have a vast quantity of goods to be counted, such an apparatus seems too expensive to consider; since but little known time may now be spent in counting and obviously the machine under such conditions will be idle a considerable part of the time. Here, however, is where a serious mistake may be made, for not much labor need be saved to pay splendid returns on the investment, notwithstanding the idle machine time.

An actual case will illustrate the fact that the saving in time may be very small, the machine idle most of the time and yet quickly pay for itself. A screw machine department had one man at twenty cents per hour counting screws, bolts and other small parts, and his errors were known to be sufficient to require a checking count by the manufacturing or stores department next receiving the goods. Three hours per day were spent in counting and recounting this one department's output. The expense was 20 cents per hour, or about $180.00 per year, on a 300 working day basis. A suitable machine for the work could be purchased for $125.00 and the investment then figured out as follows: A saving in the counting time of 75 per cent. easily resulted which amounted to $135.00 per year—an excellent investment, though the machine would be in use only a little over two hours per day. However, the saving was more than this, since the accuracy of the machine made a recount unnecessary, thus saving half the original time plus 75 per cent. of the balance. The real saving therefore was not $135.00 per year, but $157.00. This was surely a return sufficiently great to satisfy most investors. The idle time of the machine was remedied to a considerable extent for another department could use the machine to an equal or even greater advantage, thus adding greatly to the value of the machine.

A very important fact in this connection is that this saving was available and possible even though so little time was spent in counting as three hours per day, and once a trial was made further uses for the machine were quickly found. Obviously, a concern may do far less counting than the one mentioned and still be able to afford a counting machine. In fact, the usual yearly inventory alone considered, there are many instances where the machine, if used only during inventory, would still be worth its cost in time saved, not to mention the increased accuracy and consequent enhanced value of the inventory. Stock records are kept accurate only by an occasional verification of the goods on hand. For this purpose the counting machine is invaluable, greatly lightening the task, as well as increasing its reliability.

All manufacturers have some counting to do, and it is an expense well worth an investigation in all cases, for the cost of such an investigation is practically nothing and the remedy not expensive.

DRAFTING COURSE

Continued from page 301

these pieces as they would appear in shop practice. The last two portions were left vacant on this plate for the student to complete himself. We did this to make sure that the reader had followed out our instructions and understood the principle involved.

This brings us to the point where we stopped for the summer months.

From this viewpoint we will in our next lesson proceed on to further heights as the poet would say.

To use our own everyday language, and not paying attention to poetical flow, let us decide to plug along and get there, and we can only do this by earnest study. In our next plate we will discuss another, and our last plate on projections.

Having completed our study of these basic underlying principles, we will as soon as possible get onto the actual mechanical drawing, building up of a machine tool, piece by piece, later making an assembly of the complete arrangement.

We would strongly advocate that new readers write us for the seven reprints we have prepared, so that they can study in detail the work which has gone before. To our old students who so splendidly stuck to their guns during the former lessons, let us say: Polish and clean up your instruments, dust off that drawing board, and get ready for the next lesson on the subject. By way of a send-off, we will announce the prize winners on Plate No. 6 and 7 in our next issue, so watch for your name.

DEVELOPMENTS IN SHOP EQUIPMENT

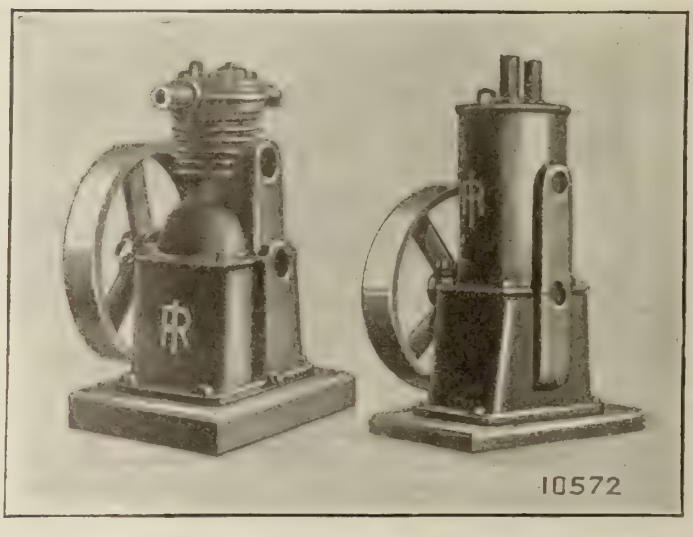
A NEW LINE OF SMALL AIR COMPRESSORS

Capacities Range from 3 to 45 Cubic Feet

THE Ingersoll-Rand Co., 11 Broadway, New York, have placed on the market a line of small air compressors, developed during the war, and known as the "Imperial Fourteen" compressors.

These machines were designed to meet exacting efficiency tests, and have been carefully watched. During a year's service they have proved themselves to be simple, efficient, reliable and economical little machines to operate.

They are made in four sizes, with capacity ranges of from 3 to 45 cubic feet per minute, at 100 pounds pressure to the square inch. Owing to the high grade materials used in their construction and the liberal factor of safety allowed in their design, these little compressors can, however, be used for pressure requirements of up to 200 pounds per square inch, the horse power required being, of course, slightly increased.



THE SMALLER TYPE WITH VANES CAST ON CYLINDER.

Single Stage Single Acting Type

They are single acting machines of the single stage, vertical type, built for belt drive.

Where they are to be driven from a line shaft, tight and loose pulleys are furnished. Where the use of an independent motor is contemplated, they are usually furnished as a unit with motor, endless belt and swinging arm short belt attachment, mounted on a hardwood base plate.

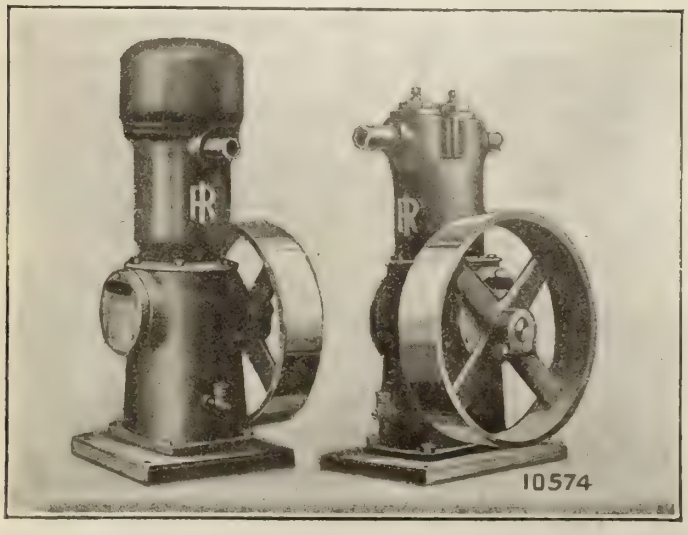
The machines have been so carefully balanced as to permit satisfactory and efficient operation if bolted to any ordinary solid flooring, but where the installation is to be of a permanent nature the use of a concrete foundation is recommended.

Methods of Cooling

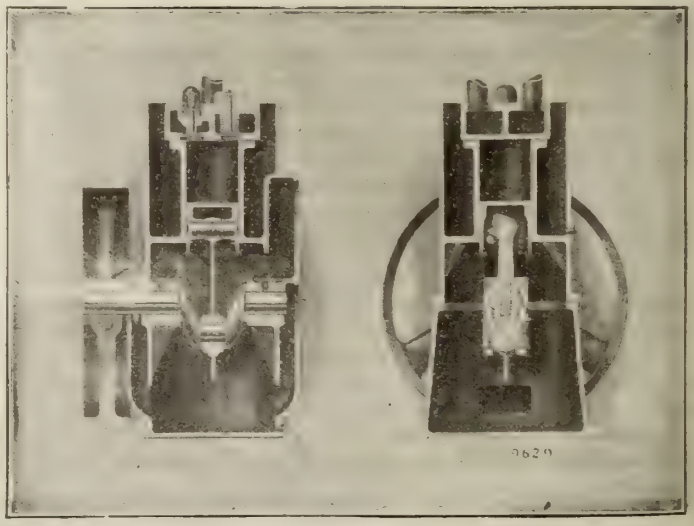
The smallest size is built with deep vanes, or ribs, cast on the cylinder, for use where the service requirements are of an intermittent nature, and with water-cooled cylinder, of the reservoir jacket type, for continuous operation.

The larger machines are supplied with the reservoir jacket system of cooling only, with the exception of the largest sized machine, which may be had equipped with a closed water jacket for direct connection to pressure system if desired.

The reservoir jacket design affords an unusually ample supply of cooling water, which acts on both the walls and head of the cylinder. A single filling of the reservoir is usually sufficient for a run of ten hours.



GENERAL VIEW OF COMPRESSOR.



SECTIONAL VIEW.

In many features of design these new compressors closely resemble the modern automobile engine. There is a similarity in the drop forged connecting rod and crankshaft, the die cast reversible white metal bearings, the automatic splash lubrication system, and the general ruggedness and simplicity of construction which characterizes machines intended for operation at high efficiency under all sorts of operating conditions.

These little machines are well adapted for the use of stone cutters, industrial plants, garages, power plant and printing establishments operating monotype machines, which require a little air at low cost all the time.

They are distributed in Canada by the Canadian Ingersoll-Rand Co., Ltd., Montreal, Que.

UNIVERSAL TOOL-HOLDER

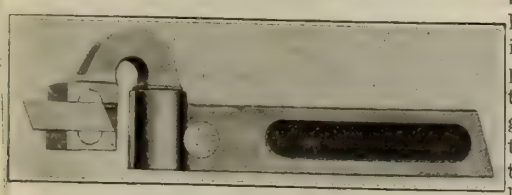
The Universal Tool-Holder Co., 1565 E. 17th Street, Cleveland, Ohio, has recently developed an adjustable spring-head tool-holder which is suitable for

THE TOOL IN ACTUAL OPERATION.

light production and tool work on steel, brass and bronze. It is especially useful for the performance of cutting-off operations, thread-cutting jobs and similar work, as the tool possesses the same utility as the goose-neck type of tool. The clamp holds 5/16-inch round, 5/16-inch square, and 3/32- by 7/16-inch flat bits.

ANOTHER VIEW OF TOOL AT WORK.

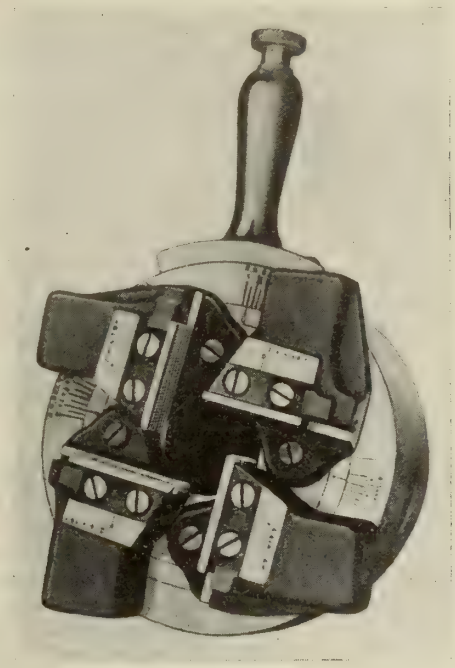
The bit or tool can be placed on the right or left-hand side of the clamp without removing or inverting this clamp. A spring clamp insures that the bit or tool will be in proper alignment. The head of the holder may be adjusted up to 90 degrees, either to the right or left. The shank and spring clamp are forged from nickel steel, and all the parts are tempered, polished, and tested by gauges. The tension of the spring is sufficient to permit the cutting of threads from 7 to 40 per inch. The various illustrations throughout show these holders at work.



VIEW OF HOLDER.

LANDIS AUTOMATIC DIE HEAD

The Landis Machine Company, Waynesboro, Pa., has placed upon the market a new style of automatic screw-cutting die head which is different in design from other heads of this type



GENERAL VIEW OF THE DIE.

in that the chasers are supported on the face of the head. This permits of easy access to the chasers when it is necessary to remove them for grinding or changing from one diameter to another. It is made of steel to insure of long life of hard service. The head is opened automatically by opening the forward motion of the carriage, and is closed by hand. It is locked by the operating handle which contains a latch having a tongue milled on the lower end. This tongue is milled off centre, thereby permitting of roughing and finishing cuts. To adjust the head for either roughing or finishing cuts merely requires a half turn of the latch to suitable graduations.

The head is graduated for all sizes of bolts and pipe, both right and left-hand within its range. It is adjusted to size by means of a screw which engages the head body. Since the operating, adjusting and closing rings remain in a fixed position when the head is closed, the rotating of the head body within these rings gives the diameters within the range of the head. To set the head for left-hand threading, the screw which locks the latch pin is removed and the latch pin is rotated to the left-hand graduation. The locking screw is then replaced and the left-hand holders are put in place.

This head is applicable to practicably all makes of screw machines and turret lathes which have sufficient space to swing heads of these diameters. The heads will be furnished with standard shanks, or special shanks will be furnished provided they will not be larger than the standard shanks. Where special shanks of dimensions greater than standard shanks are required a bushing can be used. This automatic die head employs the regular Landis chasers.

THREAD MEASURING WIRES

The measuring wires illustrated herewith are manufactured by the B. Seaboldt Corporation, 25 West Broadway, New York. The accuracy with which these wires are made and the manufacturing facilities of the makers were of material assistance in the standardization and measurement of screw threads during the period of the war. The Bureau of Standards, Washington, alone purchased several hundred sets of wires under the stipulation that they must all be within .00001 in. of the various given dimensions. In the accurate measurement of thread dimensions the three-wire system obviates the use of optical projection apparatus. Maximum, minimum and pitch wires enable thread angles to be measured to very close limits. With these devices the unskilled mechanic is enabled to make measurements with the skill of the expert tool maker.

The illustration shows the fixture used in the measuring of gauges, and by its use all the difficulties of trying to hold by the five members, gauges, wires and micrometer are obviated.

Will Industrial Conference Fail?

WHEN the Industrial Conference opened at Ottawa this week there was a good attendance. Representatives were there from the ranks of labor and from the manufacturers' side as well.

If that conference is going to get very far—and we hope it does—there has got to be something put into it that has been lacking so far.

The delegates from the labor side sat well bunched on one side of the house, while on the other side there filed in the representatives of the employers.

As long as these parties feel that it is necessary or desirable for them to have an aisle as a boundary between them in such a meeting, just so long will their meeting be as barren of results as the Sahara desert is of wheat and oats.

Coming as it does at a time when the whole nation is looking for something better than strikes and lockouts, that conference has a chance to do the big and the decent thing, and one of the biggest jobs they can turn to is kicking down the barrier that exists between the shop and the office.

Even when they were off work to attend the meeting of the Industrial Conference at Ottawa these two factions took the barrier along with them and stuck it up in the aisle.

CANADIAN MACHINERY knows of manufacturers who get close to their men, and they don't have labor troubles. The men have the regard for their employer that would brand a move against him as a wound in the house of a friend. In such cases the barrier has been removed.

The things that make up the barrier between men and employers are suspicion, lack of knowledge of real facts, and selfishness. Neither side has any monopoly on these things.

That Ottawa meeting of employers and employees should put the boots to the aisle between the two bodies. It would be worth while if the employers' representatives there got to know the representatives of the workers in the shops, even if nothing more were done.

The thing that is needed to build up satisfactory working conditions in this country cannot be put down on paper. It cannot be drawn up and agreed to in black and white. It has been demonstrated time and time again that agreements cannot make the conditions that we need. If agreements and conferences could do it, then it would have been an accomplished fact long ago.

What is needed is real genuine kindness, a departure from that miserable "pound of flesh" idea; a departure from the notion that men can run their factory on the card index system and tag their employees the same as they would tool steel or iron bars.

That Ottawa gathering needs warmth more than a bombardment of well-balanced words; capital and labor have been filled to the neck a thousand times with addresses and arguments and threats, but neither capital nor labor have been filled to the neck with a desire to put heart and soul and kindness and feeling into the daily grind.

Some of those interested in the Ottawa gathering may be hopeful for a good result. But the good result will not come unless the employers come to the point where they look upon the men in their shop as something more than an opportunity to make money, and unless the men are willing to realize and admit that the man in the office has great big problems that at times are enough to crush and break him.

There are enough agencies at work to drive the wedge in deeper between the employer and his men, but kindness, courtesy and love will do more to bridge that gap than all the other combined agencies that the world has tried in vain.

The Pickling Season

ABOUT this season of the year the woman of the house, she crooks her foremost finger toward her lawful wedded spouse, and says, "John Henry, run across unto the grocery store, for I have mapped for you, my dear, a most exactin' chore. I want tomatoes by the peck, I want green peppers, too; I want some onions, pepper, spice, to toss into the stew."

"And while you're at it, get some cloves, some whole and get some ground, that in the cellar shelves this year some victuals may be found"

Ah, yes, it is a goodly thing to pickle and to can, to line the ribs and please the taste of every hungry man; to have both catsup on the meat and pickles on the side, to give to liver and to stew a free and easy ride.

But it's a wise and prudent man who in these picklin' days doth know enough to turn his path into some distant ways.

Yes, wisdom oozes from that chap who, when this spell is on, can plan to pack his carpet bag and for the time be gone; for he is wise beyond his years, from dome unto his feet, who flees when wife campaigns upon the onion and the beet.

For if he lingers 'round the house he simply has to stand and watch friend wife mount up the stairs and then with stealthy hand, remove the razor of his choice—it makes the blood run thin—to see this instrument engage the silver onion skin.

They take his shaving mug as well, and from it cast the soap. John Henry views this latest move, and from his heart goes hope — there ain't no chance for him with ease to make a kick and win, to save the tools and riggin' for the scrapin' of his chin.

Oh, there's kettles settin' on the stove, there's bottles here and there; there's jars and sealers on the floor, likewise the cellar stair.

Yes, let the women have their fling with pickles and with spice, and build up mixtures strange to smear on liver and on rice, but let the man with wisdom teeth, with judgment cell done brown, rear up some pressin' business stuff to take 'im out of town.—ARK.

"Jackey" Fisher and Oil Engine Development

By T. H. FENNER, Editor Marine Engineering

WHATEVER one may think of Baron Fisher of Kelverstone's revelations, credit must be given him for wielding a trenchant pen. There is also little question that the policy of cencentrating the fighting strength of the Royal Navy in the North Sea was an absolutely correct one, though it called forth some very bitter criticism when first adopted. Much of this emanated from holders of sinecure positions in the dockyards scattered over the Empire in remote spots. The civilian population of the dockyard towns also lost a great deal of easy money when these bases were reduced to a skeleton establishment. Men who had been drawing pay from naval dockyards in Bermuda, Halifax, Esquimalt, etc., in return for spending a few leisurely hours daily in these places, were faced with the necessity of going to work in earnest. The presence of the staff, and the frequent calls of the vessels on the station meant good business for the local tradespeople. There was, of course, much criticism from disinterested people all over the Empire, many of whom thought the calling home of the fleets from the outer marches of the seas would diminish the prestige of Great Britain among the nations. Events have proved that Fisher was absolutely right, and the presence of the Grand Fleet in the North Sea on Aug. 4, 1914, was one of the deciding factors in the ultimate victory.

However, when he speaks about the British attitude on the oil engine there is room for serious difference with him. In his vigorous language, he formulates the statement that "This British nation is going to make the same —— mess over the internal combustion engine, which is just as imperative for commerce as for war. Every nation except ourselves is pushing ahead with this engine."

This is far from being the truth. It is true that for the duration of the war British engineers were too fully occupied in absolutely necessary war work to devote much energy to commercial work. Notwithstanding this, oil engines in Great Britain have been brought to a state of efficiency second to none.

There are a large number of firms building marine oil engines, both under license and of all-British design. Distinct types and designs have been evolved, and at least one invention has been brought forward that marks a considerable advance over anything yet achieved. We allude to the Still engine, of which numerous descriptions have been published lately. Some of the largest engineering firms in Great Britain have gone in whole-heartedly for the manufacture of both marine and stationary engines. Among these are the well-known names of Vickers, Cammell, Laird & Co., Beardmore's, Doxford's, Robey's, etc. The smaller class of marine motor for fishing and pleasure boats has for many years upheld the reputation of British builders all over the world. In engines for motor cars and aeroplanes Britain is behind no other nation. The name of Rolls-Royce stands for the highest efficiency in this direction. Coming back to the use of oil engines in commercial vessels, the largest and highest powered oil engined ships afloat are under the British flag, built on the Clyde. The "Glenapp," of 10,000 tons deadweight, and 6,400 B.H.P., has not yet been surpassed. Evidently Lord Fisher has not looked as closely into this question as he might have done, when he says, "We have no big ship so fitted, or even thought of."

There is a distinct field for the marine oil engine, but as far as can be seen at present it does not lend itself to the propulsion of high powered war vessels. As a motor for cargo vessels, of moderate speeds, it would seem to be the ideal. The advantages it has are of economy in fuel due to its high efficieney as a heat engine, economy of space, reduction of engine room crew, largely increased cruising radius. This latter effects economies by eliminating stops at coaling ports, with their attendant expense of pilotage, dues, and long delays. Against these advantages conservative ship owners have considered the almost perfect reliability of the old triple expansion steam engine, which carried their vessels on voyages running into years with safety and immunity from breakdowns. The marine oil engine, being in the development stage, was susceptible to breakdowns, especially such serious ones as broken crankshafts, which caused owners to look askance at it. However, those early difficulties are fast disappearing, and we now see firms like the Glen Line going in for oil engined fleets.

Where the oil engine's real limitation appears is in the size of the units which are practically possible. In the vessel referred to, the "Glenapp," the 6,400 horsepower is divided into two units of eight cylinders each. The horsepower developed in each cylinder is thus about 400, which is as large a unit as has been considered possible. Owing to the high compression pressures used and the pressure on bearing surfaces entailed, the making of larger units is hardly feasible. However, were it possible to make engines developing 1,000 horsepower per cylinder, consider what would be required for a battle cruiser developing 100,000 horsepower. That would mean 100 cylinders, with their necessary air compressors, air vessels, etc. Speaking at a recent discussion on the Still engine, Sir Charles Parsons made the interesting statement that to obtain the maximum power for a large cruiser the design would call for 150 cylinders on four shafts.

The writer is an admirer of "Jacky" Fisher, who unites the qualities of the old-time sailor with the breadth of vision of the engineer. However, he cannot subscribe to the great sailor's opinion that Great Britain is going to be hopelessly left in the oil engine developments of the future.

THE Ontario Safety League are out with a bulletin which says a man should not spit on the floor at home or in the shop. Well, if a man can't spit on the floor of his own parlor then things are coming to a funny stage.

* * *

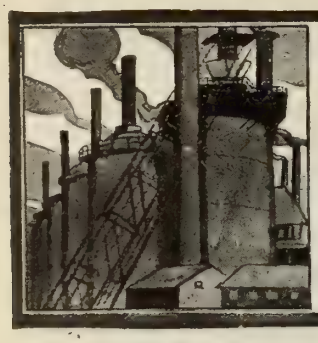
A SPEAKER at the Ottawa Industrial Conference said it helped not at all to give a man a 20 per cent. wage increase while he at the same time faced a 40 per cent. increase in the cost of living. To be sure, most of us would get out and holler for a 40 per cent. increase in wages, with living costs stationary or shrinking.

* * *

MEMBERS of the Dominion Government are working hard to qualify for a sessional indemnity of $2,500 each. They have got to get in 30 days, by hook or by crook. And so the country, up to its neck in debt, faces the beautiful spectacle of a House held in session, with, at times, speakers blazing away to 16 of the 230 members, hoping and praying that they can stick it out long enough to pocket the $2,500. How can Ottawa expect the rest of the country to take big matters seriously with a cluster of time-servers assassinating enough time to legally put them on the sessional pay roll?

* * *

THE explosion in the elevator at Port Colborne seems to have been due to the fact that blowing dust out of wheat makes it lighter. Being lighter, there is a loss of money. Therefore, the dust must stay. Dollars and dust win out against lighter grain and safety. The coroner's jury whitewashing all and sundry is a poor compliment to the intelligence of the community. It is certainly the bounden duty of some official of the Government to explain why they are afraid to order the dust blown out of wheat.



MARKET DEVELOPMENTS

New Developments in Many Ontario Cities

And Dealers Are Out for Orders—Strike in U. S. Steel Industry Seems More Certain—How It Will Affect Conditions in Canada —Plates Would Be Most Affected.

THE talk of a strike in the United States steel industry continues to increase, and if there is no good opening found for rescinding the strike order it looks as though September 22 would mark the beginning of another labor war. The Canadian industrial world is interested, particularly in the matter of plates and tubes. There are large tonnages of plate coming across the border now, particularly for boiler and tank contracts. Plate is something that is not stocked extensively, as each job has its own specifications and sizes quite apart from standards, and each is sent to the mills for rolling to size. Some of the large Canadian boiler shops have a splendid amount of work on hand, and it would be a serious matter were they not able to send their plate specifications to the mills for quick action. However, it has yet to be demonstrated that it is possible to shut off the rolling capacity by a strike. The situation in sheets, bars, shapes, etc., is better, Canadian mills having a splendid capacity for handling this material.

Machine tool dealers are finding plenty to work on in the new industrial developments that are taking place in several of the centres of Ontario just now. Several orders for new equipment have been placed by firms that are locating branches in this country.

Some idea of the size of the shops that are locating in this country can be gathered from a New York advice which states that General Motors, now building at Walkerville, will spend between two and three millions for the necessary equipment.

BRITISH AND AMERICAN FIRMS HAVE THEIR EYES ON MONTREAL SITES

Special to CANADIAN MACHINERY.

MONTREAL, Sept. 18.—The steady trend of business is undisturbed by feature developments, but industrial activity is still affected by the attitude of labor. However, the situation in this respect has been less acute of late, owing to the conferences that have been arranged by the Canadian and American Governments for discussion of the points involved between the employers and the employees. The result of the meeting now in progress at Ottawa is awaited with much interest, and there appears to be a hidden tension throughout trade circles regarding the outcome. Future conditions in industry hinge on the outcome of these conferences, and early resumption of deferred activities will depend on some satisfactory solution to the problems now confronting the country. A condition that is gradually becoming more pronounced is the interest, and in some cases the activity, that is being displayed by British and American firms, in establishing agencies and manufacturing branches in Canada. British interests in particular are feeling out the possibilities and considerable property has been acquired in this district for contemplated development in the near future. One drawback at the present time appears to be the difficulty that is experienced in getting material in from the States. One firm here, manufacturing gas engines, has been unable to secure promised shipments of parts, and no satisfactory reason can be given for the delay. Unsettled conditions are presumed to be the cause. The confidence that has been shown in steel circles during the past week, over the better outlook that prevails at the steel producing points, is still a factor of present trading, but the atmosphere is still more or less of a hazy character, and this will still affect the spirit of the market until it is definitely known what will untimately result from the negotiations now in progress. Local trading is of the quiet kind, but not excessively so. The general situation reflects the unrest that is gradually fading.

Firmness in Metals

With metals moving steadily, but in light volume the market is devoid of feature. There is no heavy demand from any quarter and dealers report little change. Spelter has become easier after the temporary strength of the past week or so; this was anticipated here and prices are not changed. The market in antimony is less active, but the strength is maintained.

Lighter Movement in Tools

While the demand for machinery just now is below normal the interest is maintained by the abnormal conditions that prevail in every line of activity. Dealers to-day, when quoting on tools, are required to take many things into consideration that were not present in pre-war times, or even while the war was on. The uncertainty of delivery, the demands of labor, the possibility of strikes, the changing rate of exchange, etc., all combine to place the dealer in a position where definite quotation is next to impossible. If a customer is quoted a price on a certain machine, and delay arises before an order is placed, there is frequently some explanation required to convince the purchaser that the first price does not hold. In this way the difficulties that are incidental to making sales, are of a character to keep the dealer busy, even though the actual turnover is of a small scale. Dealers here report light sales, but apparently are disposed to believe that better buying may develop a little later in the year. Inquiry for supplies is a little quieter just now, but the light demand is comparatively steady.

Prices Easier, But Market Firm

The movement of scraps at the present time is of a limited character, as the current demand is comparatively light, and the existing conditions are such as

to influence buyers to act in a conservative manner. Despite the quiet tone of the market the dealers are optimistic on early conditions, and they believe that the situation will develop strength shortly. The bulk of the business at present is being done in machinery scraps, as considerable demand is continually coming in from the smaller iron foundries. The volume, however, is seldom large, as the general policy is to cover only for a short time ahead. The industrial conference now on at Ottawa will hold the attention of the trade interests, as much depends on the outcome between the representatives gathered at these meetings. Local quotations show a slight easing of prices, but apart from this the market is very firm. Copper and brass scraps are quoted down from ½ to one cent per lb. Light copper is quoted at 15 cents, and crucible and heavy is bringing 18 cents per lb. Yellow brass, on a decline of one cent, is quoted at 9 cents per lb. Aluminum scrap is selling locally at 18 cents. Dealers here have reduced the quotation on machine cast scrap and the price of $20.00 shows a decline on the week of $3.00 per ton. Stove plate is also lower, havin gdeclined from $17 to $15 per ton.

NEW DEVELOPMENTS ARE SATISFACTORY

Machine Tool Dealers State That a Buying Movement is Well Under Way

TORONTO. — Developments that are taking place in a number of the industrial centres of Ontario are interesting the machine tool dealers in no small way. New lines are being developed, and new equipment is being called for, several very nice orders having been placed within the last few days.

Talk of a strike in the steel mills of United States still continues to interest the warehouse and shop trade in this country. Reports still appear contradictory regarding the real size of the strike menace.

In the Steel Market

A slight change in the majority of quotations from warehouses has been put down this week, whereby small shapes are the same as iron and steel bars. For some time past many of the warehouses have been quoting a slightly higher figure for small shapes than for bars, the former being at 4.50 and the latter at 4.25. Now there has been an arrangement made whereby the quotation of 4.25 will cover them all. Small shapes take in many lines of ornamental iron work, angles, T shapes or channels, and material for fire escapes, elevators, etc. In fact there is not a machine shop of any size in the country which does not use the material that comes under the classification of "small shapes."

Dealers here realize that plate is the weak spot in the market. Delivery dates are still well ahead in some cases, but there can be no denying the fact that a good sized mill order from Canada would bring the 2.65 price down, the distance down perhaps depending on the size of the tonnage and the attitude of the buyer as to whether there was any urgency in the order. A New York despatch referring to plate says:

A rather definite break has taken place in plates. Some of the larger mills have evidently decided not to leave all the more attractive inquiries to mills which have been taking domestic as well as export business at 2.50c., Pittsburgh, and while 2.65c. is still the quotation with leading makers, large offerings may be covered with no great difficulty at the lower figure.

In the Event of a Strike

The plate situation is where the pinch would come to this country in the event of a strike. The size and quantity of plate that can be rolled on this side of the line is extremely limited as yet. Firms handling big marine work, or boiler and engine contracts are dependent entirely on U.S. for their plate supplies, and they have been sending in some very large tonnage during the past few months. Should there be a cutting off or a serious curtailment of the output it would be a serious matter for several of the plants on this side, that at present have business on hand that should run them well on through the winter months. Plate is something that cannot be stocked for a wide range of work, as orders for each individual job are usually forwarded to the mills.

Whether or not Canadian business has been getting the 2.50 treatment at the U. S. mills is not known, but it is known for a fact that although 2.65 has been the accredited price, that a better figure has been secured on several tonnages.

The Machinery Market

That some of the largest makers of good machine tools on the continent have sent out notices cancelling all stock orders is an indication of the trade that is in sight in this line. For instance, if a man in Toronto has a real sale for a machine he sends it in, and if there happened to be others nearing completion that were for stock in some other territory, the "real sale" would have preference, and the stock machine delivery sale would simply be shoved on into the future by an extra month or so. The latest move discourages firms from putting machines in stock, as the delivery dates are very indefinite.

There is a nice lot of business coming in from a wide range just now. There are three or four cities in the industrial section of Ontario that are attracting quite a bit of attention just now. Developments that are taking place at Brantford, Kitchener, Hamilton, Windsor district, and other centres are keeping machine tool salesmen on the move to see that nothing is getting away from them.

The sale of small tools is better this week than for some time past. City orders have been very satisfactory, and considerable out-of-town business is coming along, all helping to round out some very nice bookings. Prices remain stationary, although there is a tendency on the part of some of the firms to keep on cutting lists and prices. One of the dealers, referring to this tendency, said that they knew what the stock cost them, and they knew what they had to sell for, and apart from that new lists and discounts are secondary.

Plating Supply Markets

Firms handling plating chemicals report that they have some trouble in publishing a price list, or in correcting such tables as are published in this paper. Here is the way one manager put it to CANADIAN MACHINERY this week: "We give you a price for our lines, based on a reasonable sized order, when along comes some chap with a thimbleful order, and wants to get the best prices, claiming that the paper quotes a lower price than he paid. It is true in a sence. The published price generally is

POINTS IN WEEK'S MARKETING NOTES

New York reports that General Motors at Walkerville are buying between two and three million dollars' worth of equipment.

—

Pittsburgh refuses to admit entirely that the strike is going to come in the steel trade, but there is an absence of the note of certainty that the mills used a few weeks ago.

—

There is not very much export business being done by the makers of machine tools at present.

—

Machine tool makers in the United States have in some cases sent out notices cancelling stock orders, and giving preference to any bona fide sales. This shoves on the delivery date of stock machines almost indefinitely.

—

Dealers in plating supplies report business brisk, and with the coming into operation again of more shops that have been closed by strikes, they see even more hooking in sight.

—

Steel plate is the one weak spot in the market, and it is known that orders have been placed as low as 2.50, although the price quoted is 2.65. Strike talk may change the concessions that are being made for good tonnages.

—

A strike in U. S. mills would be bad business for Canadian shops using much plate and tubes. For bars, sheets, etc., Canadian mills are well equipped to attend to the business.

—

Developments that are taking place in several of the industrial centres of Ontario are providing good material for the machine tool salesmen.

a very good figure because it represents the sale as it would be in an average piece of business. So the prices that are quoted elsewhere should be taken in this way. It will be noticed that prices quoted are by the pound unless otherwise stated. So it means that a person coming into the market with a good order would possibly get a better price than that named in the list.

The tendency of prices for plating material is upward for the reason that production has been seriously curtailed. There has been a good volume of business moving for some time, and the trade reckons that when foundries and other shops where plating is done get over their strike fevers and start handling the usual volume of business there will be a great deal more to be handled. Although nothing has been done this week the tendency is for a higher price in polishing wheels, felt and bull-neck.

GENERAL MOTORS ARE BUYING HEAVILY FOR WALKERVILLE PLANT

Special to CANADIAN MACHINERY.

NEW YORK, September 18.—The machine tool requirements of the General Motors Corporation for its Walkerville, Ont., plant constitute the most important activity in the machine tool markets. Purchases will total, it is stated, $2,000,000 to $3,000,000, and most of the orders will be placed at Detroit and Cleveland.

The General Motors Corporation is also buying quite extensively for its tractor plant at Janesville, Wis.

In New England and in the Chicago, Cleveland and Detroit districts the demand for new equipment is in very fair volume. Elsewhere in the country, and particularly in the New York territory, it is relatively quiet. Labor troubles are generally credited for the lull in the Eastern States outside of New England.

Many machine tool builders have a good back-log of orders, and deliveries are being extended on some lines. Prices show a continued upward trend, and the present schedule is about on a par with prices which prevailed during the war, and in a few instances higher. Some makers of drills have advanced uprights about 15 per cent., and radials 10 per cent. Buyers now seem to realize fully that machine tool prices cannot remain stationary while labor costs are advancing and sellers meet with comparatively little argument on the price question.

Little Export Business

Export trade is almost at a standstill. Japan is still buying, but nothing is being done of any importance with European countries. The largest export order placed in some time was awarded last week by the Standard Oil Co., of New Jersey, for about 50 tools to be shipped to the oil fields of Rumania. Other equipment, consisting principally of plate-shop and structural shop machines, are yet to be purchased.

The E. W. Bliss Co., Brooklyn, has purchased the plant of the Consolidated Press Co. at Hastings, Mich., and will buy considerable new equipment to increase its capacity.

The American Locomotive Co., New York, has bought fifteen overhead cranes ranging from 10 to 30 tons capacity for three of its plants. Three of the cranes are for the Montreal works.

NEW YORK CITY TO HAVE A GREAT MACHINERY EXHIBIT THIS FALL

CONSIDERABLE progress is being made with the International Macinery Exposition—the permanent display which is to open in Grand Central Palace, New York, on October 15.

The exposition will include exhibits of manufacturers and selling agencies of engines, lathes, milling machinery, planers, drills, screw cutters, presses (hand and power), boring, can-making, wood-turning machines and others of similar nature, prime movers, machine tools, presses, lathes, milling machines, belts, drills, radials, gear shapers, chucks, turrets, bearings, grinders, taps, welders, slotters, screw cutters, borers, can-making, wood-turning, saw-making, tack-making, and other automatic machines of various types—in short, every modern machine used in making machinery. Many of these, both large and small, will be shown in actual operation.

The new enterprise enjoys phenomenal backing. The Nemours Trading Corporation, of which Alfred I. du Pont is president, owns and controls the Merchants' and Manufacturers' Exchange of New York, which operates the Palace. It has branches in all of the leading cities of the world, consisting of 19 branch offices and 3,000 foreign selling agencies.

The exposition will fill a long-felt want in its own particular field. The development of both foreign and domestic trade to which the venture looks forward unquestionably will be remarkable during the next few years, and in this development the Merchants' and Manufacturers' Exchange in general, and the Machinery Exposition in particular, will be big factors.

Already the fame of the enterprise is spreading throughout the world, and newspapers and trade papers in many foreign countries have commented upon it most favorably. It is practically assured that Grand Central Palace is destined to become a mecca for buyers both domestic and foreign.

One great talking point of the Merchants' and Manufacturers' Exchange is that buyers going to the Palace who are interested especially in one line of goods in one exchange, will also take advantage of the opportunity to visit the other expositions and exchanges in the building at the same time, with the result that they will find other things of interest in addition to what they went especially to see.

When one stops to consider what this will mean to the man who is in the market for equipment or supplies, its advantages are obvious. In one great salesroom will be found the products of the leading manufacturers side by side. Visitors will attend for similar purposes and the interchange of ideas and experience thus afforded will result in more accurate buying—better business for all concerned.

NEW LIST FOR COLD ROLLED AND DRAWN

A new price list has been issued by the United States mills and adopted by the Canadian mills for cold rolled, cold drawn, turned and polished steel, and as there is apt to be confusion in the minds of buyers when the new list comes out with such radical changes, an explanation of this list may be a help to our readers.

Ever since cold-drawn steel appeared on the market, it has been sold on the basis of a list price for the various sizes and shapes, with a discount which varied according to the market, therefore all quotations were made in the form of a discount. The new list now takes the same form as the hot-rolled steel, or iron bars, namely, a base price with extra for size and shape. It is only necessary for the buyer to know the base price and to add the extra for the particular size or sizes he may be ordering. The base price applies to all material covered by the new price list, that is, the same price base, is applicable to rounds, squares, hexagons and flats, or other shapes. It is not necessary to remember the list price of each individual size and take the discount from it, but all that is required is to remember the extra that the different sizes take over the base price.

Agency for B.C.—C. W. Sherman, president of the Dominion Foundries and Stee, of Hamilton, went West earlier in the month, and while in Vancouver decided to establish an agency there for shipbuilders' and railway supplies. Most of the business is at present in American hands, but the discount on Canadian funds makes the time opportune for securing a portion of this business. Shipbuilders on the Pacific Coast have been large users of American dyes and castings.

THE STRIKE LOOMS AS POSSIBILITY IN THE U.S. STEEL SITUATION

Special to CANADIAN MACHINERY.

PITTSBURGH, PA., SEPT. 16.—In last report the statement was made that the labor situation in the iron and steel industry was "greatly improved" and that "the universal opinion among manufacturers is that a general strike, such as was threatened, is out of the question." Since those opinions were expressed the "strike committee" of six, representing the 24 unions that have been attempting to organize the iron and steel industry, have called a strike for Monday, September 22. The calling of a strike came as a great surprise, but it would occasion no great surprise were the strike order rescinded, and this may be done if the committee find a good or easy way out.

Of course, there is a matter of "mob psychology" involved. It is not certain what a mass of men will do. They may be stampeded. There are various pieces of information, and various actions of the strike committee, all pointing strongly to the idea that the committee has been bluffing, first in hopes of securing the censent of Judge Gary to hold a conference with them, and next, when that failed utterly, in hopes of securing intervention by President Wilson. It is a common opinion that President Wilson became impatient of organized labor more than a month ago, but even if that were not the case, his announcement of a general conference of labor, to be held October 6, obviously precludes his taking a hand at this time. If the strike committee wants his assistance all it needs to do is to await the results of the conference.

Evidently that is precisely what the strike committee did not want to do. It had worked the men up to a certain pitch of excitement, and the excitement would die out if it were not continually fed. Whatever chances a strike call had of being effective would decrease day by day. The first threat was to call a strike the Saturday night before Labor Day, to occur the day after Labor Day, making a time interval of two and a half days. The strike call now actually issued involves an interval of 11½ days. It is presumed that the much longer time is set in hopes that something can occur meanwhile whereby the strike committee can "save their faces" and call off the strike call.

At a few plants large numbers of the common workmen, particularly the foreign born, were "organized," while at many plants there was no success at all. The process of organizing the ignorant foreign-born workmen was very simple. The organizers said in substance: "We are going to control employment at this plant in future. You can join now for $3 and save your job. Afterwards the initiation is going to be $25." It is understood that when the $3 was paid the organizer got $2 and $1 went into the treasury to pay general expenses, including the printing of membership certificates. Thus it is possible that there will be actual strikers as some plants and nothing at all at others. Another possibility is that there will be practically no strikes and another is that the strike call will be recalled.

The incident has had little effect upon the iron and steel market, which pursues the even tenor of its way, with no great amount of activity as to open market sales because the mills are comfortably sold up. As a rule they have been indisposed for several weeks past to accept orders except from regular customers. There is only a moderate volume of new inquiry in the market, but with so much business being turned down the inquiries have to go the rounds and thus the apparent volume of business offered is magnified .

Steel Production

Steel production in August was at the rate of a shade under 80 per cent. of estimated capacity, against 73 per cent. in July and about 50 per cent. at the middle of May, showing a remarkably sharp recovery, but the rate of last January or February has not yet been attained. These percentages are based upon an estimated capacity of 49,000,000 of steel ingots a year, which is a conservative estimate, and the monthly reports of the American Iron and Steel Institute. The August report showed that 2,746,081 gross tons of steel ingots were produced in the month by 30 companies which in 1918 made 84.03 per cent. of the total of steel ingots produced by the industry.

It is very important, as throwing light upon the general situation, to note that while the actual production in August was about 80 per cent. of capacity, the capacity actually idle in the month was not 20 per cent. There was very little actual idleness. The common interpretation of this apparent discrepancy is that the works in operation did not produce the tonnage of which they are normally capable because labor is not at normal efficiency. This is a common complaint and covers not only men who are paid by the day or hour, but also men who are paid by the ton. The tonnage men, it appears, receive such high rates per ton that in many cases they do not bother to turn out the last ton of which they are capable.

Steel Corporation Tonnage

The Steel Corporation had in August a third very good month in the matter of booking business, chiefly of the contract variety. For six months, December to May inclusive, the corporation's unfilled obligations fell off quite steadily, and by an average of about 640,000 tons a month. Then the situation was suddenly reversed. While May showed a decrease of 518,375 tons in the unfilled obligations on books, June showed an increase of 610,545 tons. July followed with an increase of 685,806 tons, and last week's report showed an August increase of 530,442 tons. While the August increase was less than the June increase the actual bookings were larger, shipments in August having been about 175,000 tons greater than those of June. The Steel Corporation now has on books a total of unfilled obligations equal to six months of shipments at the present rate. The business is not equally distributed among the various department, but there is much less divergence than usual. The contract obligations of the corporation are not all specified against by the buyers, but the proportion is unusually high, probably considerably more than 50 per cent. of the total obligations being in actual orders of specifications, either on mill books for rolling or in shape for entering.

Pig Iron Prospects

Steel products being absolutely pegged at present prices, since in present circumstances mills regard advances as quite undesirable, and there is no possibility of declines, there is much more interest in pig iron prices, for there are possibilties there of fluctuations. Some of the furnaces are anxious to get the market up, and in fact, on foundry iron a number of districts record actual advances over the March 21 schedule. Many furnaces, on the other hand, are opposed as a matter of general policy to there being advances. There is likewise, a divergence of feeling among consumers. Some have been fearful that there would be advances for next year's deliveries, perhaps large advances, and in order to protect themselves they have bought, even paying slightly advanced prices. Such buyers have been much in the minority. Other buyers are looking for declines rather than advances. Others, and probably the majority, are neutral, preferring to take no action and being willing, if prices do advance, to pay the advanced price when the time comes. Western Pennsylvania and valley furnaces generally are maintaining former prices, those of March 21. Some small tonnages, for this year's delivery, have been sold at slight advances in the case of foundry iron, but not in the case of other grades.

The firm of Hamilton & Hansell, Inc., 13 Park Row, N.Y., have made the following announcement with regard to a change in the firm's name. They will be known from now on as the American Transmarine Company, Inc., and will carry on business as importers and exporters and international merchants. The followings firms will be associated with them:—Transmarine Company, Stockholm; Transmarine Company, Ltd., London; Holmberg, Beech & Co., Rio de Janeiro; Brazilian Transmarine Company, Santos; Compania Commercial Traco Sociedad Anonima, Buenos Aires; Javasche Transmarine Handel Maatschappij, Batavia; Transmarine Co.. de Cuba; A. B. Handel & Industri, Petrograd; American Transmarine Company, Inc., San Fransisco.

Geometric Production

Installing a Geometric Die Head, or other Geometric equipment, has increased production materially in many plants where an increased output was a vital consideration.

Below is an illustrated instance where a Geometric Die Head (threading machine type) was applied to an old bolt cutter and the production increased six times over what was being done with a solid die head.

Before taking it for granted that you are getting the best possible production on screw threaded parts, let us know what the work is, and we may be able to boost production for you.

The Geometric Tool Company, New Haven, Conn., U.S.A.

CANADIAN FIRM COMING CLOSER TO OLD COUNTRY SHIPBUILDING COST

Special to CANADIAN MACHINERY.

OTTAWA, September 18.—The Government is pushing on with its shipbuilding programme, and the tendency seems to be towards an improvement in the prices. They have now before them for consideration the construction of four more two-deck poop bridge and forecastle ships of twelve knots and 8,400 tons each, and the price quoted is the most favorable yet received, being about $170 per ton. The quotation is from Vickers of Montreal.

There is now only about ten per cent. difference between the quotations from Vickers and the most of building in Great Britain for standard ships, with the advantage that our standard is higher than theirs for similar ships, quotation received from the Old Country being about $166 per ton. Taking into consideration the fact that wages at Vickers in Montreal have gone up about 11 per cent., and hours reduced about 6 per cent., showing a nominal loss in production of from 3 to 6 per cent. it would appear that the Canadian builders are getting their work down pretty fine.

Australia has a very ambitious shipbuilding plan under way, and appear to be building very low, but reports are somewhat conflicting. According to official figures furnished our Canadian Department of Marine, the prices there in May ranged from $140 to $165 per ton. Since the beginning of the war the Australian Government has spent over fifty million dollars on their commercial fleet. The programme includes fourteen steel vessels, shelter deck type, 331 feet B.P., 48 feet wide by 33 feet 7 inches deep, moulded to shelter deck, from 5,500 to 6,000 tons deadweight. They are about the same as the Canadian 5,000-ton boats. The cost of these figures work out at about $141 per ton. Costs of later ships seem to have been considerably higher, but the Government there is going on with its shipping operations regardless of criticism, of which there seems to have been a good deal there as there has been in Canada of our Government programme. At present forty steamers are being operated by the Commonwealth Government, and it has also been directing the course of about nineteen ex-enemy steamers. Only ten per cent. of the men employed in shipbuilding had had any previous experience, and the Government of the Commonwealth believe that with increased experience they can reduce their costs.

There are no figures available as to the exact rates paid men engaged in shipbuilding in Australia, but the presumption is that they are considerably lower than here, although they seem to have advanced considerably since the estimate of $140 per ton for construction as above mentioned was made. Their platers, for example, average about fifty dollars per week, while ours are said to average nearly double that sum.

WANT TO KNOW WHY SYDNEY STEEL PLANT HAS BEEN CLOSED

Sydney, N.S.—The appointment of a royal commission to investigate the closing down of the plant of the Dominion Iron and Steel Company here is to be requested of the Federal Government by the city council.

The following resolution presented by Alderman A. J. McDonald, Ward 5, was adopted at Thursday evening's session of the council and is to be forwarded to Ottawa at once.

"Whereas numbers of the employees of the Dominion Iron and Steel Company have been deprived of employment because of the shutting down of portions of the plant.

"And whereas no satisfactory statement has been made by the Dominion Iron and Steel Company as to the time when operations will be resumed.

"And whereas even a temporary suspension means a hardship to many of our citizens.

"And whereas the said Dominion Iron anl Steel Company has been the recipient of municipal, local and federal concessions.

"Be it therefore resolved, that the City Council memorialize the Dominion Government requesting the said Government to appoint a royal commission to ascertain why there has been a cessation of operations by the company.

"And further be it resolved that the importance of immediate action on the part of the Government be urged in the interests of the workingmen and business interests of the city."

Recommending the adoption of the resolution, Ald. McDonald pointed out that unless immediate action were taken by the council for investigation of local working conditions, the working problem would become a serious one.

"The closing down of the plant," he said, "has been the cause of an exodus of hundreds of our best native-born citizens to other provinces. Cape Breton is an isolated part of Canada, and once our people leave for the West and for the States their return is not probable.

"Resumption of operations at the steel plant will bring, after a time, a flow of foreign labor of an undesirable class into the community, a class which is a danger and a drawback to the interests of the city."

Alderman McDonald was given full support in his views by other members of the council and the resolution presented by him was unanimously adopted.

MONTREAL NOTES

Owing to an appeal made by the citizens of Montreal, the action of the Tramways Company in advancing the rates has been deferred, pending the decision of the Railway Commission.

The Gates Refractories, Ltd., of Montreal East, are just completing a 60-ton kiln for the making of fire brick. It is expected that two others of similar capacity will be in operation before the close of the year.

If present plans materialize the Nova Scotia Steel and Coal Company will construct a by-product plant for the production of coke at an approximate cost of $2,000,000. An additional blast furnace will probably be included in the new developments.

A. G. Clark, of the Geo. F. Foss Machinery and Supply Co., Montreal, has been appointed to the position of advertising manager, not manager of the small tool department as stated in last week's issue. Mr. Clark will still continue to act as the firm's accountant.

The Oil Engine Works of Canada, Ltd., 29 Prince Street, Montreal, are now manufacturing the Hvid Thermoil engines. For the present their activities will be concentrated on the 6 and 8 h.p. sizes, but eventually this will be enlarged to meet every requirement of the trade. M. L. G. Vincent is the managing director.

Paul Mercier, consulting engineer for the City of Montreal, has resigned. Mr. Mercier joined the city staff in May, 1914, as deputy chief engineer, and when the late Geo. Janin went overseas with an engineering unit in the fall of the same year, he acted as engineer-in-chief until January, 1916, when on the death of Mr. Janin he was duly appointed to the first position. His reorganization of the Public Works Department was responsible for a saving of over 50 per cent. in the operating expenses during his term of office. In May, 1918, he was appointed director of public works, under a new scheme adopted by the Administering Commission. In November, 1918, he was given the position of consulting engineer.

Walter Lambert, M.I.N.A., who has been serving in the capacity of assistant to director of steel shipbuilding in Canada for the past two and a half years, will shortly re-establish the activities that he was engaged in prior to his appointment to the Government position. The work of the Imperial Munition Board will soon be terminated and Mr. Lambert will re-open an office to carry on the business of naval architect and marine surveyor, in which he was actively engaged prior to May, 1917. In his position of assistant to director of steel shipbuilding he has been responsible for the construction of all steel vessels built in Canada to the order of the Imperial Munitions Board, and likewise for the hulls of all wooden steamships built in Eastern Canada. In addition to his previous activities of naval architect and marine surveyor, he will carry on the business of ship broker.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Finished Shop.—In St. Thomas the M.C.R. have just completed new shops of very fine construction.

Put in Furnaces.—The Volta Manufacturing Company, Welland, have installed an electric furnace for the Walker Metal Products Co., Walkerville.

Grant to New Industry—The property owners of Cobourg have voted in favor of a by-law to grant the Douglas Packing Company $5,000 towards securing an adequate supply of water for their new plant. The plant consists of five new buildings erected on the site of the old steel works.

Japs Have Trouble:—T. Hiroto, managing director of Ocean Transport Co. of Kobe, Japan, announced in San Francisco that owing to excessive costs of ship construction in Japan, and the inability of Mikado's builders to accept and turn out orders, Japanese are planning to come to San Francisco to have additional tonnage constructed.

Another Grain Explosion.—A nest of grain elevators in Kansas City had an explosion followed by fire recently. The cause of the explosion was attributed to spontaneous combustion of grain dust. The walls and top of the elevator were wrecked by the explosion, and one man was found 350 feet away. About 20 men were injured more or less seriously by the accident.

Coal Mine Re-Opens.—The Dominion Coal Company has opened the New Victoria Mine at Sydney, N.S. This mine was closed down as far back as 1902, and was re-opened in 1913, but was closed down again at the outbreak of war in 1914. At the time it was closed down in 1902 the mine had a capacity of 1,800 tons per day and employed about 400 men.

Employment Good in Stratford.—The Government employment bureau of Stratford has been in operation six months. During that time the bureau has secured employment for 529 men and women. and at the present time there are only four men on the list unemployed. The 529 does not include those who have been passed to the vocational part of the bureau.

Did He Double?—One story going the rounds in connection with the starting of a steel company at Goderich is as follows: A Toronto man went in and signed a lease on a store for a five-year term. The same afternoon he sold out for twice the sum he had paid. We have no good authority for the story, but stranger things have happened.

Fire in Chatham.—The spring department of the Dowsley Spring and Axle Works was totally destroyed by fire recently. The spring department occupied a separate building, and it is said that the dipping of a red-hot spring into an oil tank in the ordinary process of tempering started the blaze. A west wind was blowing and the flames spread rapidly. The damage amounts to about $50,000.

The Federal Board for Vocational Education, Washington, D.C., have issued Bulletin No. 31 on "Training Courses in Safety and Hygiene in the Building Trades. This publication is a well-illustrated volume of 125 pages and is replete with useful and practical information relative to safeguarding from industrial accidents in the building trades. The material which has been incorporated in this work embraces a great majority of the accident hazards in the building trades.

Ottawa Employment Statistics.—According to reports from the Employment Service of Canada at Ottawa, there is no serious unemployment in the Dominion. The Government employment officers all over the country were placing on an average of 10,000 workers per week, and during the harvesting rush this number was increased to 12,000. The total number of applications from March 1 to August 23, was 190,455. During the same period 201,785 positions were offered by employers, and 139,492 persons were placed in positions. The service moved 15,000 workers to the West for the harvest, and made it unnecessary to import labor for this purpose.

Strike on the Welland.—The workers on the Welland Canal went on strike last week, thus fulfilling their threat. The trouble is over the non-payment of time and a half for overtime, as was agreed to at the recent settlement with the contractors. At that time, the agreement was that the men would receive the same payment as the Hydro canal men were receiving. The working day was set for eight hours, and work over that length of time was to be paid for at the rate of time and a half. Some of the men found that they did not make enough when working only eight hours, and asked the contractors to let them work ten hours. The contractors say that as they did not ask the men to work, they should not be asked to pay overtime rates for the extra time.

PERSONALS

George Clarke, brother of S. L. Clarke, Perfect Machine Co., Galt, has been secured as superintendent of the Perfect plant. He was formerly with the Kingston Locomotive Works as pattern maker and designer, and has had recent experience with large concerns in United States.

The death is announced from Trenton, of Robert Weddell, the prominent harbor contractor. Mr. Weddell was well-known in Toronto, and was the contractor for the Western entrance to Toronto harbor. He also was successful in bringing in the intake pipe after the Works Department had made several unsuccessful attempts. He was a personal friend of Mayor Church and George Wright of the Walker House. He leaves a son.

Mr. Ignace Schilowsky, consulting engineer with the Youroveta Home and Foreign Trading Co., 165 Broadway, New York, has been spending some days in this district. Appointed by the first provisional government following the revolution in Russia in 1917, Mr. Schilowsky came to America with the Russian ambassador. Of course the present Government in Russia does not recognize any of these appointments, and so it is that the Russian legation of that time is now interesting itself in preparing for the development of mineral deposits in Russia as soon as conditions there will permit. "Before the war," stated Mr. Schilowsky, in discussing Russian mineral wealth, "the country was supplying much of its own copper, using up-to-date methods, although financed by foreign capital. Iron ore in Southern Russia is also found very near to large deposits of suitable coking coal. The development of these deposits was undertaken largely by French and Belgian capital." The new developments will take place in Siberia, where there is potential wealth. The Irtysh Corporation, financed by English people, has already done much here, and will proceed again as soon as the people in control there decide in which direction they are going. During his stay in this country Mr. Schilowsky has visited the Shawinigan plant, Montreal, asbestos mines in Quebec, Ottawa, Sudbury, Toronto and Niagara, being especially interested in water power development and the various methods that are used in treating metals in this country.

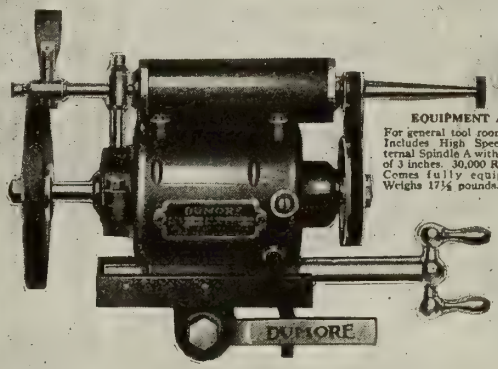
"Limits of .0001 are Easily Maintained with DUMORE Grinders"

IN selecting a grinding tool for your shop, consider the merits in the light of two all-important mechanical principles—**speed** and **balance.** The fact that small emery wheels will not cut properly unless driven at high speeds has been established beyond question. But with high speeds there must be perfect running balance **(dynamic).** Accuracy can be obtained only when chatter, taper and bell-mouth are eliminated.

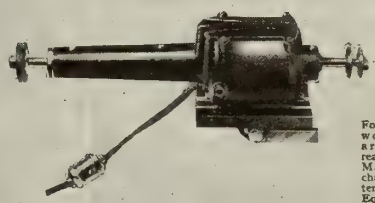
The **DUMORE** grinder is mechanically perfect because these two great principles are incorporated in its construction. Speeds ranging from 10,000 to 50,000 R. P. M., combined with dynamic balance, insure accuracy to .0001. Then, too, the **DUMORE** is portable—easily carried to all parts of the shop and quickly set up ready for work. Its constant use and endorsement by thousands of mechanics is highest proof of its value.

Efficient, economical production is largely a matter of standardizing on parts. This, of course, means making dies, jigs and gages. Here is where a **DUMORE** grinder in your shop will solve your problems. Your dealer will be glad to demonstrate it and give you further information.

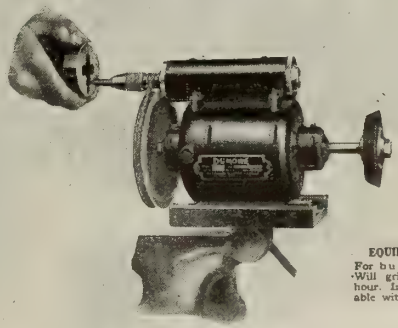
WISCONSIN ELECTRIC CO.
2915 Sixteenth St. RACINE, WIS.



EQUIPMENT A
For general tool room use. Includes High Speed Internal Spindle A with reach of 3 inches. 30,000 R.P.M. Comes fully equipped. Weighs 17½ pounds.



EQUIPMENT B
For deep internal work. Extension arm has 10-inch reach. 10,000 R.P.M. Arm interchangeable with internal spindle on Equipment A.



EQUIPMENT C
For button dies. Will grind 20 an hour. Interchangeable with A and B.

TENDERS

It is understood that in the near future the authorities of the port of St. John, N.B., will call for tenders for extension of the grain conveyor system to berths 14 and 15.

The Municipal Council of Chatham are asking for tenders for the construction of a concrete bridge known as Lepines Bridge. Plans and specifications can be obtained at the secretary-treasurer's office, St. Philip d'Arg., and tenders must be in before September 15.

Tenders are called for by the Montreal Harbor Commissioners, and will be received up to September 16 for cribwork construction timber, shipbuilding timber and railway ties. Information can be obtained from F. W. Cowie, chief engineer, or M. P. Fennel, secretary.

The Department of Public Works will receive tenders up till September 17 for the reconstruction of the eastern breakwater at Quaco County, St. John, N.B. Plans and specifications can be obtained at the office of the district engineers at St. John, N.B.; Halifax, N.S., and the post office, St. Martins, N.B.

The Township of York is calling for tenders for tarvia pavements and concrete sidewalks on several streets in the township. The tenders will be received up to September 13, and plans and specifications can be obtained from the engineer, Frank Barber, 40 Jarvis Street, Toronto.

The Department of Public Works ask for tenders for building a concrete reservoir for the Ontario Hospital, Hamilton, and for a nurses' home at Kingston. Tenders must be in by September 15th. Plans and specifications may be obtained at the office of the Bursar at either of these institutions, or at the office of the Department, Ottawa.

The Department of Railways and Canals are asking for the construction of Bobcaygeon section of the Trent Canal, tenders to be delivered by September 29. Plans and specifications can be obtained from the Superintendent Engineer, Trent Canal, Peterborough, and from the Department, Ottawa.

Tenders for the dredge cutting and embankment, reinforced concrete, etc., and furnishing and installing a submerged centrifugal pump for the Big March Drainage System, Pelee Island, Ont., will be received up till Sept. 18, 1919. Plans and specifications can be seen at the office of Alex. Baird, C.E., at the town of Leamington.

The town of Hanley, Sask., want tenders which will be received up till Sept. 24th, 1919, for the supply of the following machinery One internal combustion engine, generator, exciter, switchboard, transformers, meters. The supply and delivery of poles, erection of pole lines, and erection of power house. Plans and specifications can be obtained from the consulting engineers, Murphy & Underwood, Saskatoon, and the Secretary-Treasurer, Hanley, Sask.

The Poplar Island Shipyard, New Westminster, is being sold up, and tenders on the plant and equipment are being called for. This includes electrical, steam and air machinery of the usual type used in the shipbuilding work. The time limit for receiving tenders will be Sept. 13, and full particulars can be obtained from Arthur H. Edwards, Vancouver, for the Imperial Munition Board.

The Department of Militia and Defence want tenders for the purchase of material in the one-storey frame building erected on the west side of Park School, St. David's Street, Toronto. Building consists of a dining room 40 by 108 feet, two small kitchens, and connecting passages. Tenderers will have one month in which to remove the buildings and clear the site. Tenders will be received up to September 30 addressed to the Commanding Officer, Royal Canadian Engineers, Military District No. 2, 149 College Street, Toronto.

INCORPORATIONS

F. F. Fry Ltd., have been incorporated under the Ontario Companies Act, to carry on a general contracting and engineering business. The capital will be $40,000 in 400 shares of $100 each, the head office being in Toronto.

The National Metal and Waste Ltd. has been incorporated to carry on a general business as dealers in old materials. The capital stock is $40,000 divided into 400 shares of $100 each, and head office in Woodstock.

The Merritton Clay Products Co., Ltd., has been incorporated to carry on business as manufacturers of terra cotta, brick, tile, etc. The capital is $50,000 in 5,000 shares of $10 each, the head office being in Toronto.

The Belt Grip Pulley Company of Canada, Ltd., has been incorporated to carry on business as manufacturers of all kinds of pulleys and wheels. The capital stock is $200,000, divided into 20,000 shares of $10 each, the head office being in Toronto.

The Electric Furnace Co., Alliance, Ohio, have issued in pamphlet form a paper recently read by T. F. Bailey before the American Institute of Chemical Engineers at Boston, Mass., on the subject of "Resistance Type Electric Furnaces for Melting Non-Ferrous Metals." This paper is of much interest to those having to do with melting of metals in the non-ferrous foundry, and gives an indication as to the success of the electric furnace in this field.

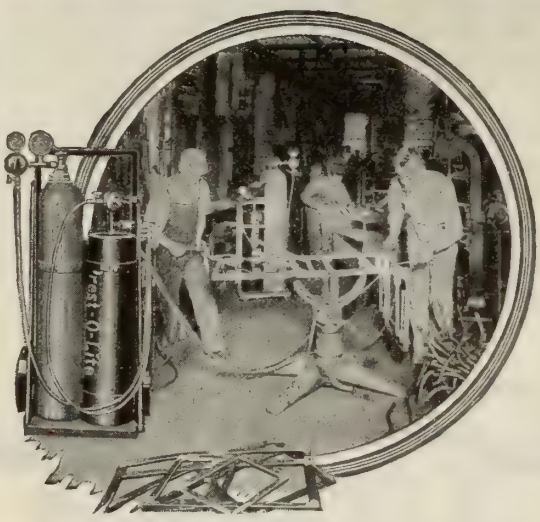
Oxy-Acetylene Welding and Cutting



Better Work at Less Cost

In thousands of machine shops, mines, railroad shops and factories, both in Canada and the States, the adoption of the Prest-O-Lite Process of Oxy-Acetylene Welding has made possible many important improvements and economies in manufacturing and repair work.

Leading manufacturers are increasing their output and making stronger, neater products at less cost.

On repair work alone, one Prest-O-Lite welding operation frequently pays for the outfit by avoiding a replacement or preventing a tie-up.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow-pipe, automatic regulators and gauges, and all necessary equipment, adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

War Record Not Made Public

The "Whitney" Special Quality "Type M" Chains

made a great showing during the war years 1916-7 and 1918.

Our tests and demonstrations were made on prominent 8-cylinder motors in service on a large number of cars in the State of Connecticut.

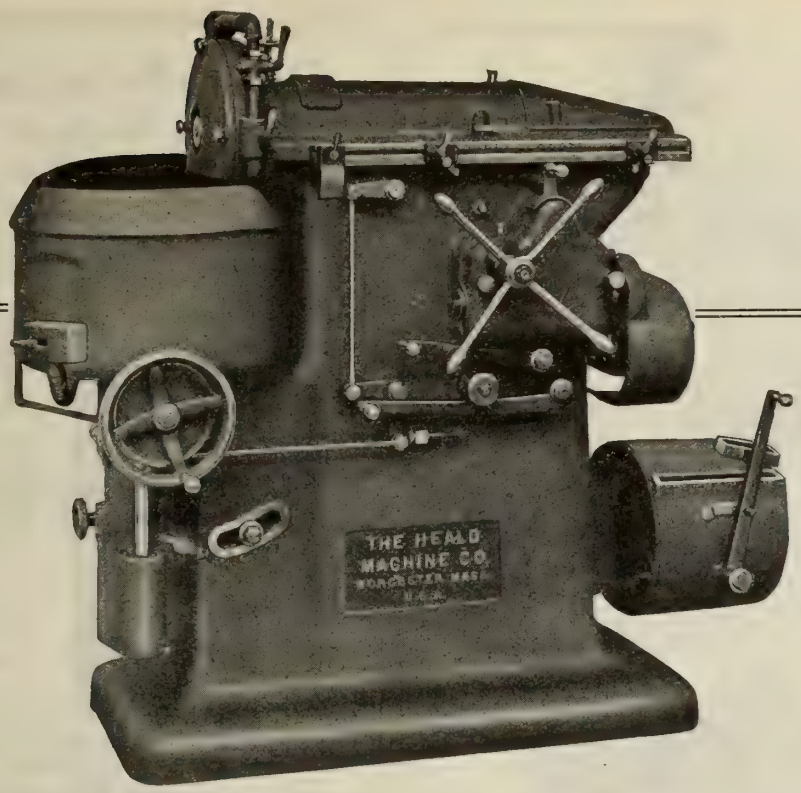
During this long period not a single "Whitney" Chain or Sprocket had to be replaced and the condition of every Drive has been pronounced remarkable.

One Drive recently examined had given over 35,000 miles' service and both Chains and Sprockets were in such perfect condition that they appeared good for more than double that record (Sprockets having no adjustment).

The links of this SPECIAL CHAIN have finished faces and reamed holes, and the smooth faces do not damage the Sprocket teeth.

Our war contracts were such that we did not announce this SPECIAL CHAIN until after the conflict was over.

THE WHITNEY MFG. CO.,
Hartford, Connecticut



BUILT IN TWO SIZES 8" and 12"

The New Surface Grinder you have been looking for.

The new HEALD No. 20 and No. 22 MACHINE is a simple, productive and accurate rotary surface grinder. That the new machines meet the first requirements can be seen from the photograph above.

In regard to production and finish, experiments have proven these new machines have no equal in the field to-day.

The WHEEL SLIDE is a massive casting having a flat and "V" way insuring continued alignment. Bearing surfaces are large and well protected. Spindle belt operates with a downward pull; an important factor in rigidity.

The chrome nickel WHEEL SPINDLE is mounted in large bearings, all adjustments of which are made at grinding wheel end through an opening in top of slide.

The MAIN DRIVE UNIT receives power from the main line by tight and loose pulleys, transmitting it directly by belt to main speed box, wheel spindle and pump.

MAIN SPEED BOX, situated on the rear of machine, furnishes power to wheel slide by a 3-step cone, and operates the chuck, which has three speeds, through a bank of gears. Wheel slide and chuck are independent of each other, permitting a large latitude in speeds and feeds.

Chuck spindle is driven by spiral gears, one of which is mounted directly on the spindle. Spindle itself is mounted in a sleeve which has vertical adjustment. Upper portion rests in a taper bearing, lower end being equipped with ball bearings —wear is automatically taken up. All control levers and adjustments are within easy reach of operator.

Complete water apparatus is furnished with each machine; built in two sizes, 8" and 12", with Heald Magnetic Chucks are regular equipment. Motor drive if desired.

Twelve Landis Universals grinding ball races

Read this comment from one of our customers:
"We find these machines particularly well adapted to this class of work. Rigidity, as in all grinding operations, is particularly vital in the grinding of a ball bearing race way. We have found these machines entirely satisfactory in that respect."
On the particular job referred to, Landis "Universals" are grinding the holes of inner ball bearing race ways. The hole is 2.1653 inches in diameter. Number of bearings finished in nine hours, 170. Grinding time, 2 minutes. Total time, including chucking and handling, 3.18 minutes. Landis Universals make good either in tool room or shop.

LANDIS TOOL CO., WAYNESBORO, PENN.

"The Marshalltown Throatless Shears"

guarantees perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

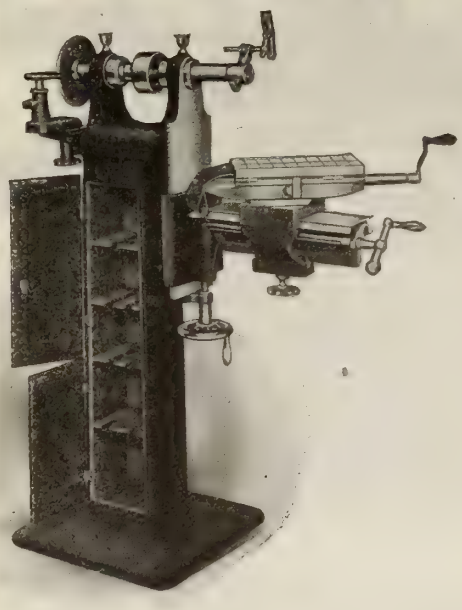
OBTAIN THE BEST RESULTS



GARVIN No. 3, Universal Cutter and Surface Grinder
Use Code—Banish

From Cutters and Tools Kept Sharp on

GARVIN No. 3 UNIVERSAL

CUTTER AND SURFACE GRINDERS

Simple **Light Running** **Accurate**

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swiveling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14" x 6"; SURFACES, 9½" x 6"

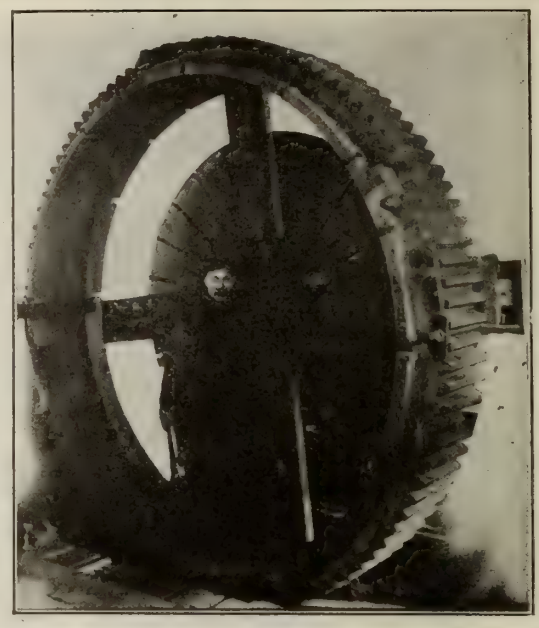
Economy A Big Factor In "HISCO" Moulded Gears



In the installation of new machinery in the working out of new processes—you may require gears or sets of gears, and no matter what the diameter, the Hesco process relieves you of the necessity of having patterns made—entailing considerable cost and delay.

"HISCO" machine moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high lumber and wages, and when time is a factor—is something to be considered.

The "HISCO" plant is equipped to produce machine moulded gears up to 18 feet in diameter without patterns—and remember, very often the pattern has cost more than the gears.

IT IS IMPORTANT

when advertising that as many prospective buyers as possible read what you are selling. We advise you to use **Canadian Machinery.**

The Canadian Who Bullied the Bolsheviks!

WHEN war broke out, Colonel "Klondyke" Boyle took across, at his own expense, 200 staunch Yukon volunteers. He was sent to Southern Russia, and in six weeks turned the transport system there from chaos into efficiency. He fed the starving Russian and Roumanian armies. He arranged temporary peace terms between Bolsheviks and Roumanians. Aided by twenty Chinese murderers and a brave Canadian girl, he bluffed the Bolsheviks and Austrians, in a tremendous exploit which won for him the title "Saviour of Roumania," and the personal thanks of the Roumanian royal family.

Read this story of "Klondyke" Boyle, by Arthur Beverley Baxter, in September MACLEAN'S—it starts on page 13.

"Growing Under Gouin"

—tells the amazing story of development of Quebec Province during the past fourteen years —in road-building, finances, industries and education.

"Meet Mr. Habitant"

—What does the rest of Canada know about the Habitant of to-day? Does he talk like Drummond's poems? This article, by Thomas M. Fraser, forcibly depicts the assets Canada has in French-Canadian stability and thrift, and will go far to remove any lingering prejudices which may exist in some minds.

Other Big Features

The Crowning of the King—By J. K. Munro, the pungent, pithy, political pundit.

Nuorteva's Propaganda—By C. H. Cahan, K.C., recently Director of Public Safety.

The White Eagle at Niagara—By Major C. R. Young, late adjutant Polish Army Camp.

The Problem of Our New Canadians—By Nellie McClung.

His Majesty's Well-Beloved—By Baroness Orczy.

Canada's Great National Asset—By D. B. Hanna, president Canadian National Railways.

Teddy Bear—A wonderful, poignant, Robert W. Service poem.

On Leave—A light, frolicsome story by Harry Bailey.

Evil Spirits—Another Bulldog Carney story, by W. A. Fraser.

Ebb and Flow—A new story by C. W. Stephens, who wrote "Man and Wife."

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

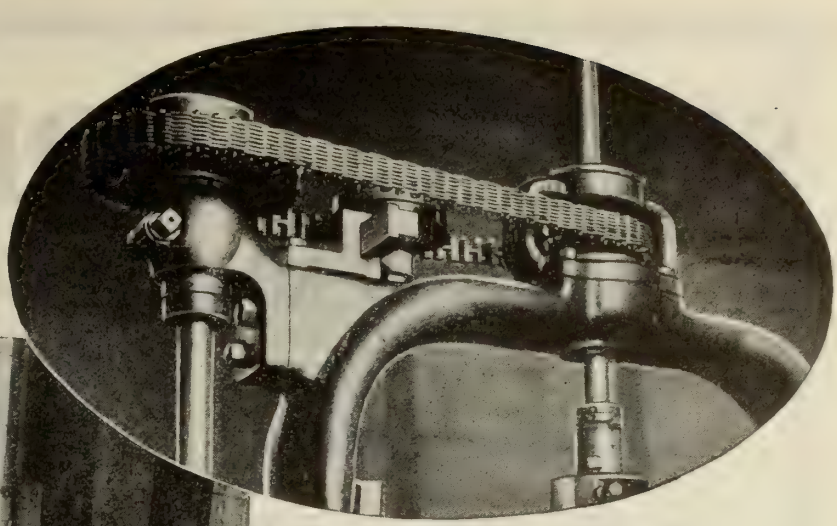
Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

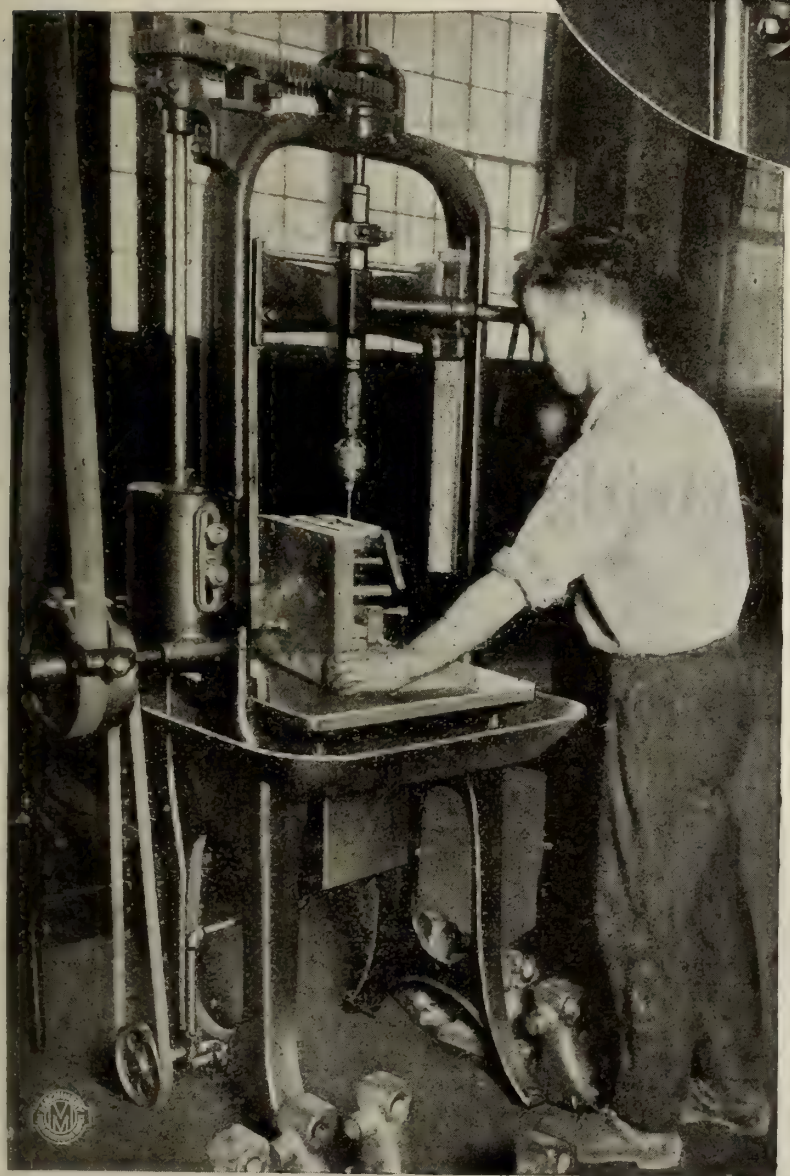
Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

KEARNEY & TRECKER CO.

MILWAUKEE, WIS. U.S.A.

The Drive for High Speed or Heavy Service





Gearing in this capacity would be noisy and would depreciate rapidly. Belting would necessitate a large idler and the power loss would be prohibitive. Chain is the answer to a problem of this kind—Morse Chain.

There are Reasons Why This New Drilling Machine is Driven by Morse Silent Chain

This new drill is a product of the Edlund Machinery Co., of Cortland, N.Y., and is designed for heavy duty drilling at high speeds.

As may be seen, a vertical drive shaft parallel to the drill spindle extends upward from the feed change box to the top of the machine.

From this point a 1" Morse Silent Chain transmits power to the vertical shaft which drives the drill spindle. The sprocket on the drive shaft has 37 teeth, that on the drill spindle 25.

With the drive pulley running at 500 R.P.M., four spindle speeds are obtained —380, 660, 950 and 1215 R.P.M.

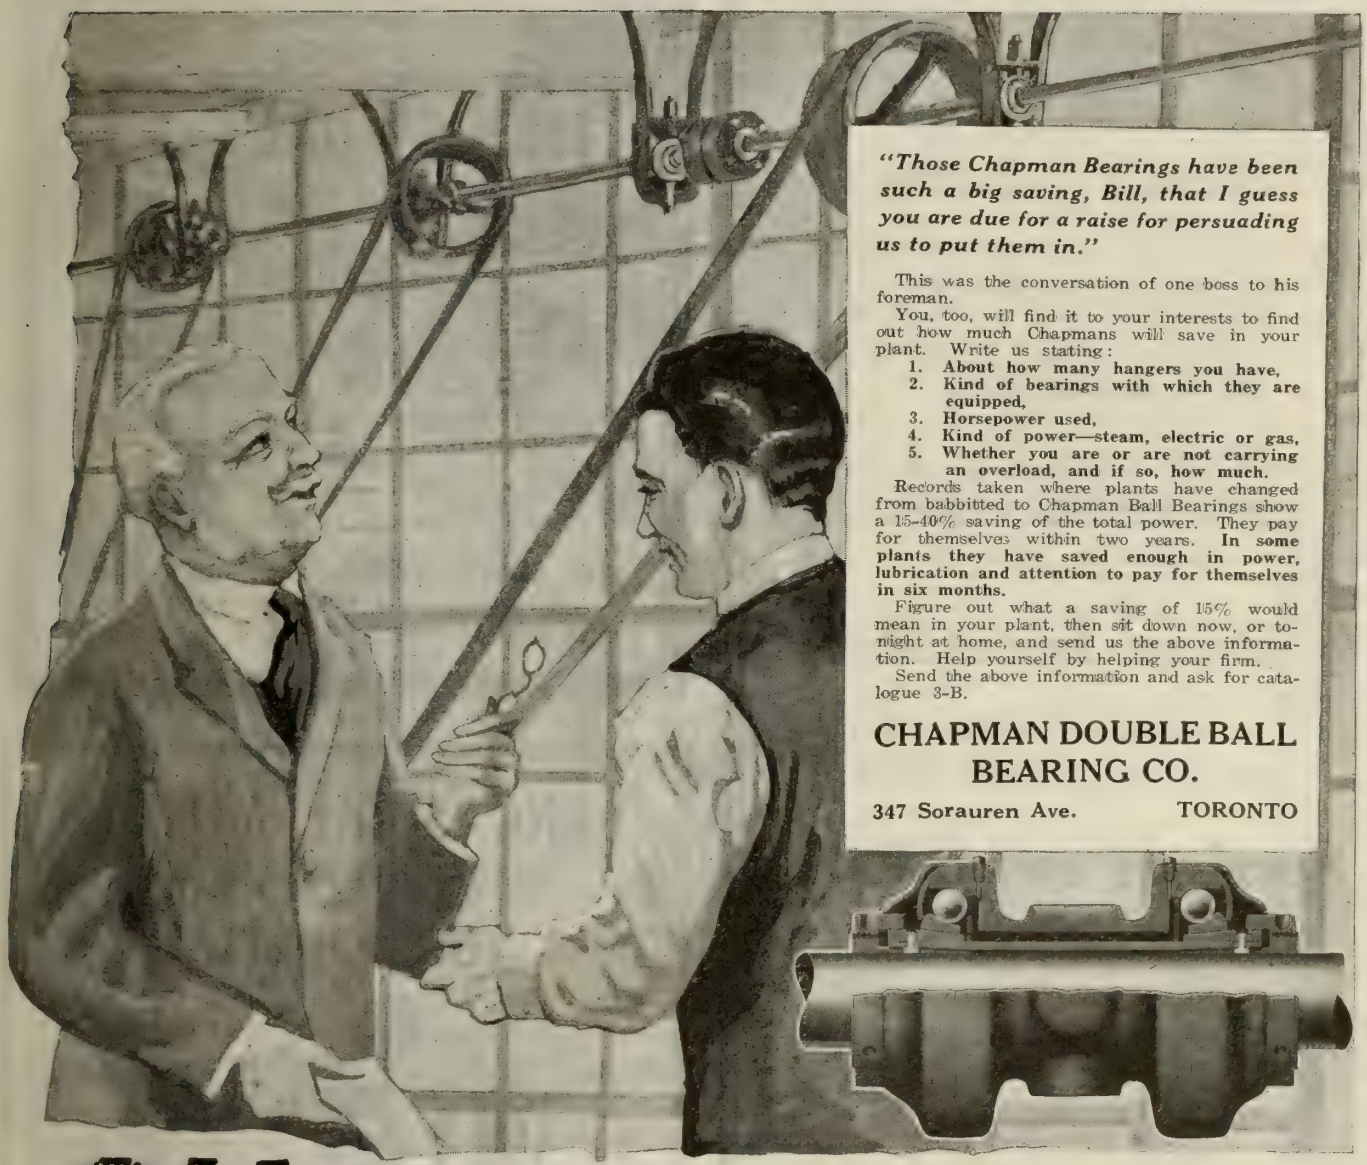
RAISED!



"Those Chapman Bearings have been such a big saving, Bill, that I guess you are due for a raise for persuading us to put them in."

This was the conversation of one boss to his foreman.

You, too, will find it to your interests to find out how much Chapmans will save in your plant. Write us stating:

1. **About how many hangers you have,**
2. **Kind of bearings with which they are equipped,**
3. **Horsepower used,**
4. **Kind of power—steam, electric or gas,**
5. **Whether you are or are not carrying an overload, and if so, how much.**

Records taken where plants have changed from babbitted to Chapman Ball Bearings show a 15-40% saving of the total power. They pay for themselves within two years. **In some plants they have saved enough in power, lubrication and attention to pay for themselves in six months.**

Figure out what a saving of 15% would mean in your plant, then sit down now, or tonight at home, and send us the above information. Help yourself by helping your firm.

Send the above information and ask for catalogue 3-B.

Nichrome Castings

for Heat Treatment

Speaking of the efficacy of carbon monoxide in the cementation and case-hardening of steel, the noted Italian physicist, Dr. F. Giolitti, says:

"At all the temperatures used in cementation practice, carbon monoxide carburizes iron exclusively through its specific action as a gas."

With the machined gas sealing cover, furnished with the "Sealtite"pot as shown in the figure, no fire-clay is required for sealing the cover, and the heat treatment penetration shows a large percentage increase over that of iron and steel pots and requires less time.

Write for further particulars.

Chicago Representative: H. S. Huncke, 15 N. Jefferson St. Pacific Coast Representatives: The Chas. A. Dowd Sales Co., 320 Market St., San Francisco. Foreign Agents, Canada: The Jas. Buckley Co., St. Nicholas Bldg., Montreal. England: Goodchild & Partners, Ltd., London, W.C. 1.

116 MILES OF THREAD

without removing the CHASERS" from a NAMCO DIE

"Figure It Out for Yourself"

"The set of ½"—13 Chasers mailed to you is from a No. 3 NAMCO Revolving Type Die Head." *Without removing from the Head* they have cut 240,000 Cap Screws—length of thread 1½". "Figure it out for yourself."

The above information, furnished by a user, is not the result of a test run. Nor is it claimed that this unusual performance establishes a record for NAMCO Die Heads, because with a new set of chasers, they turn out accurate work and will continue to do so indefinitely.

Your experience with threading tools will tell you that *without* the fundamentals of correct design, precise workmanship and good chasers, such performance as this with an Opening Die Head is hardly possible.

The same principles of sound construction have proved that Namco Dies, operated under widely varied conditions, will give all in accuracy and length of service that can be expected from first class threading tools. In many other cases, such as the above, they are giving more. "Figure it out for yourself."

Built in Revolving and Non-Revolving Types—for every threading requirement. Catalog?

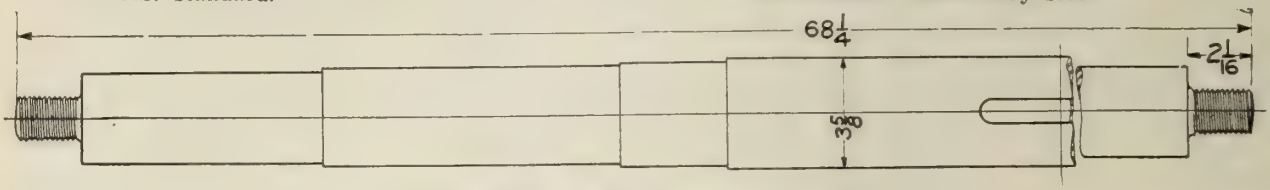
Smalley-General

THREAD MILLING MACHINES

Will give you a short cut to lower-cost thread milling.
Study the blue print and time study as given below.

MACHINE—Smalley-General Thread Miller No. 2.
THREAD—1½ in. diameter, 2 1-16 length, 6 pitch U.S. standard.

PIECE MILLED—Axle for tractor.
MILLING FEED—4.35 per minute.
MATERIAL—Machinery steel.



Tractor Axle Operation
TIME STUDY

5 minutes 37 seconds floor to floor milling both threads. Each thread milled in 65 seconds. Balance of time handling. Barker 3-jaw chuck used which had 12 in. unsupported overhang turn main spindle bearing to thread.

NOTE.—These parts were chucked through the rear end of main spindle. This was an awkward operation because the pieces were larger in the centre and the type of chuck would not let them through. A collet chuck with false collets would have permitted faster chucking.

Consult us on every phase of Thread Milling.

We will show you how to cut the costs.

ARMCO IRON Welding Rods

OXY-ACETYLENE ELECTRIC

make *safe* welding easy

Armco Rods are 99.84 per cent. pure iron. No other fillers equal them in purity and uniformity of composition. Two kinds of rods of guaranteed analysis, one for electric and one for oxy-acetylene welding, do all the work (and better work) that formerly required many different compositions. Armco Rods flow freely, weld evenly, and give a joint that lends itself practically to all finishing operations. Send for booklet.

Railroad Results

Results reveal more than words—for this reason, we suggest that you inquire in the different shops and judge by what you see and hear about the many accomplishments of

Brown & Sharpe Heavy Service Milling Machines

Then send for our Milling Machine Book which describes the construction of one of the most practical machine tools found in any modern shop.

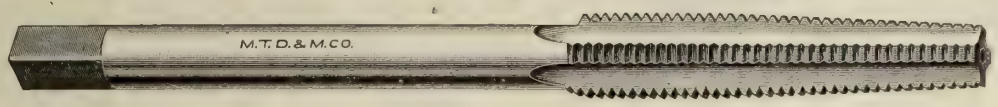
"MORSE"



TAPS

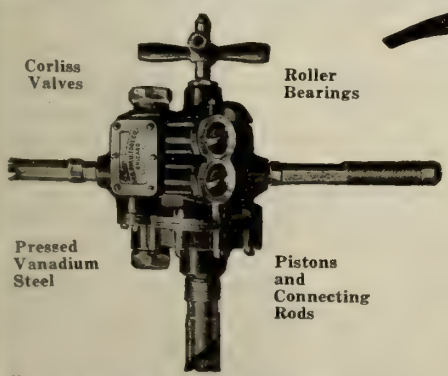
ARE FREE CUTTING TOOLS OF UNIFORM QUALITY AND ACCURACY. THEY ARE MADE FROM TOUGH, ENDURING STEEL, AND IN EVERY WAY FITTED TO RENDER SATISFACTORY SERVICE.

[*SEND FOR CATALOG*] **MORSE TWIST DRILL & MACH. CO.**
NEW BEDFORD, MASS., U. S. A.

Thor

Pneumatic Tools

Piston Air Drills and Reamers



Corliss Valves

Roller Bearings

Pressed Vanadium Steel

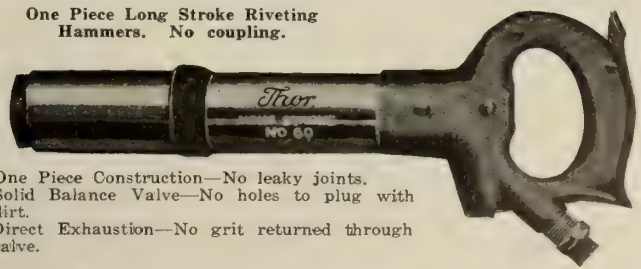
Pistons and Connecting Rods

Four cylinder type, two on each side. Semi-Corliss valve close to each pair of cylinders gives greater efficiency and power, saves clearance losses and allows air to enter cylinder at full pressure of the pipe line.

SPEED UP YOUR PRODUCTION AND BE PREPARED FOR THE COMING BOOM

Chipping, Calking and Flue Beading Hammers.

One Piece Long Stroke Riveting Hammers. No coupling.



One Piece Construction—No leaky joints.
Solid Balance Valve—No holes to plug with dirt.
Direct Exhaustion—No grit returned through valve.

Four sizes, 1″ to 4″ stroke. The barrel and all wearing parts are hardened and ground, making the Thor Chipper practically free from vibration.

Williams' "Agrippa" Tool Holders

"The Holders that Hold"

TO keep pace with the rapid progress of the metal-working industries, speed—and hence economy—in production is essential. In modern shops, using heavy cuts and continuous high speeds, Williams' "Agrippa" Tool Holders meet the most exacting demands satisfactorily.

They are sturdy, dependable tools, the result of nearly half a century of experience in the specialized production of *Superior* Drop-Forgings, and are made in a wide range of sizes for all regular machining operations:—Turning, Boring, Planing, Threading, Knurling, Cutting-off and Side Work.

Our Booklet describes them fully—may we send it?

"Agrippa" Turning Tools are furnished in either Cam or Set Screw Pattern.

J. H. Williams & Co.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Grinds within .0004 in. of absolute Accuracy

BRISTOL MACHINE TOOL CO.
SUCCESSORS TO C. G. GARRIGUS MACH. CO.
BRISTOL, CONN.

Look at this again —closely

and read what we have to say below

WHEN a tap breaks off close or below the surface, you'll find the Walton Tap Extractor will save a great deal of time and trouble. The crucible fingers grasp the flutes of the tap, a twist of the wrench and the piece is out.

Don't you think it would pay to have a few lying around on your benches?

The Walton Company
Hartford, Conn.

We wanted something original— this is what we got

BOTH in these operations and half another — I'll show you later — completed in the time our old taps took to do one; that, I guess, is why we continue to use your Victor Collapsible Taps."

It was the often-heard story of time saved, of costs lowered, of all threads clean and smooth. And it was pleasant to hear.

Victor Tool Company
Waynesboro, Pa.
U.S.A.

No. 153 with Two Sets of Jaws.

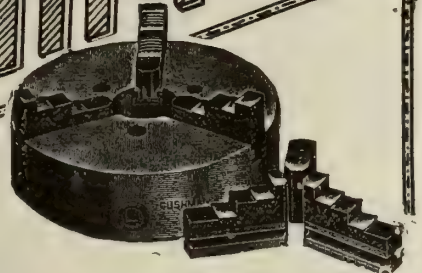
Union Geared Scroll Chucks

Have many points to recommend them. SOLID BODY —Gives strength and rigidity. WEIGHT—All parts are heavy and strong, and reinforced where necessary.

QUALITY OF MATERIAL—Best that can be procured.
LAST AND BEST OF ALL—ACCURACY. Union Chucks are Accurate.

UNION MANUFACTURING COMPANY - New Britain, Conn., U.S.A.
26 Cortlandt Street, New York — Makers of a Complete Line of Chucks

Cushman



The "Cushman" Chuck of to-day is the fruit of nearly sixty years of Chuck building

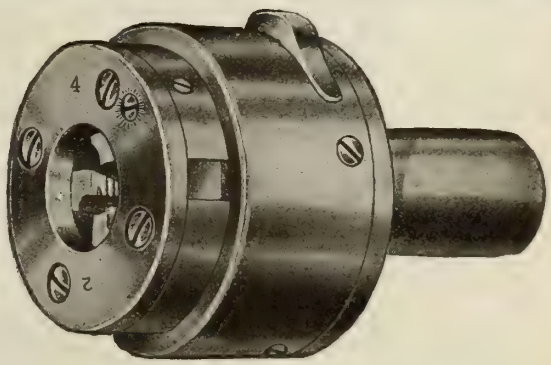
And right from the start in 1862, they have been known throughout the industry for their high quality Material and Workmanship.

The CUSHMAN Chuck of to-day embodies every up-to-date improvement of a long line of FAMOUS CHUCKS.

Send for our Catalogue showing complete line of Lathe Chucks, Drill Chucks and Portable Face Plate Jaws.

Cushman Chuck Co., Hartford, Conn

CHUCKS



H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Butterfield

TWIST DRILLS GEAR AND MILLING CUTTERS

(Carbon and High Speed Steel)

Quality

Prompt Delivery

They're the happy result of a great combination of specially trained men and the finest special machinery—these Butterfield carbon and high-speed steel Twist Drills, Gear and Milling Cutters, Side Mills and End Mills, with straight or spiral flutes and plain or nickeled teeth. Their ability to serve accurately and long equals that of Butterfield Taps, Dies and Reamers — the sincere praise of a thousand users wouldn't be a better recommendation.

The Butterfield Catalog, just off the press, fully describes these better tools and how they increase production. Write for your copy.

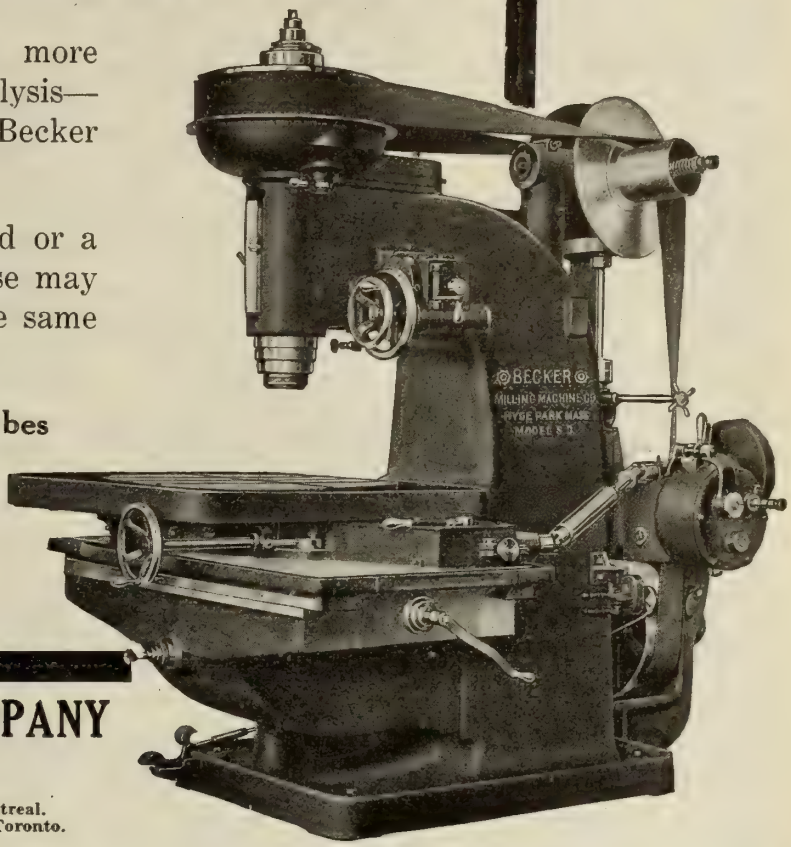
BECKER BELT DRIVEN CONTINUOUS MILLERS

Increased production, lower costs, more perfect parts—and in the last analysis—efficiency; are attained by the use of Becker Continuous Milling Machines.

One set-up does for fifty, a hundred or a thousand duplicate parts, as the case may be; and each will be finished to the same dimensions.

Write for circular 0-601, it describes

THE MACHINE THAT GIVES THE SMOOTH FINISH



BECKER MILLING MACHINE COMPANY

Hyde Park, Boston, Mass.

Canadian Agents:

Rudel-Belnap Machinery Company, Ltd., 137 McGill St., Montreal.
A. R. Williams Machinery Company, Ltd., 64 Front St. West, Toronto.

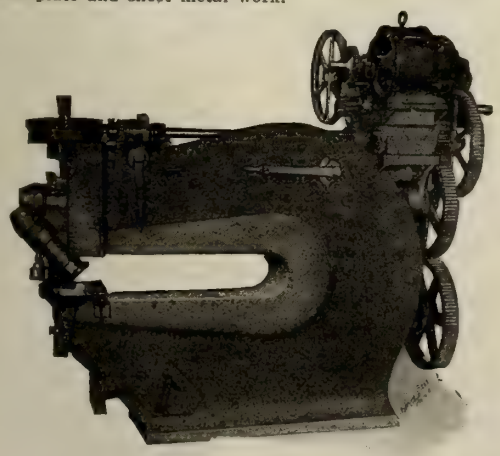
"QUICKWORK"

Registered in U.S. and Foreign Countries.

ROTARY SHEARS

MADE IN 7 SIZES.

Cut all gauges of sheet and plate metal up to 1 inch thick in straight or irregular shapes and openings without cutting in from side of sheet. Leaves square, true edge that requires no finishing. Used in building ships, boilers, tanks, cars and general plate and sheet metal work.



Patented June 3rd, 1913

SAVES 50% TO 90%

Eliminates Oxyacetylene Cutting and Plate Planing.

Write for Catalogue No. 60.

THE QUICKWORK COMPANY, ST. MARYS, OHIO, U. S. A.

Cable address: "QUICKWORK."
Codes: W. U. and General.

SERVICE

and "THE COVENTRY" Noiseless Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Noiseless Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

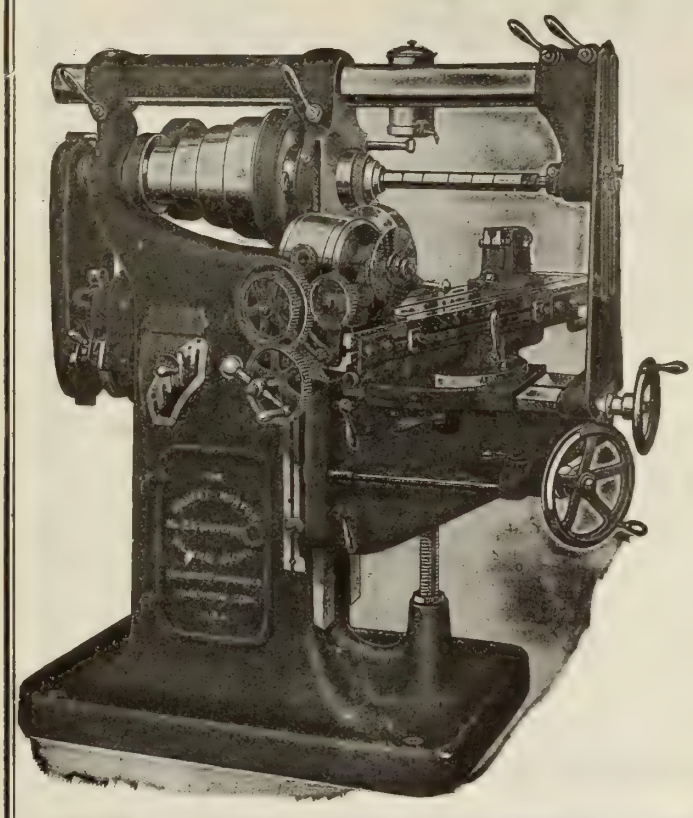
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

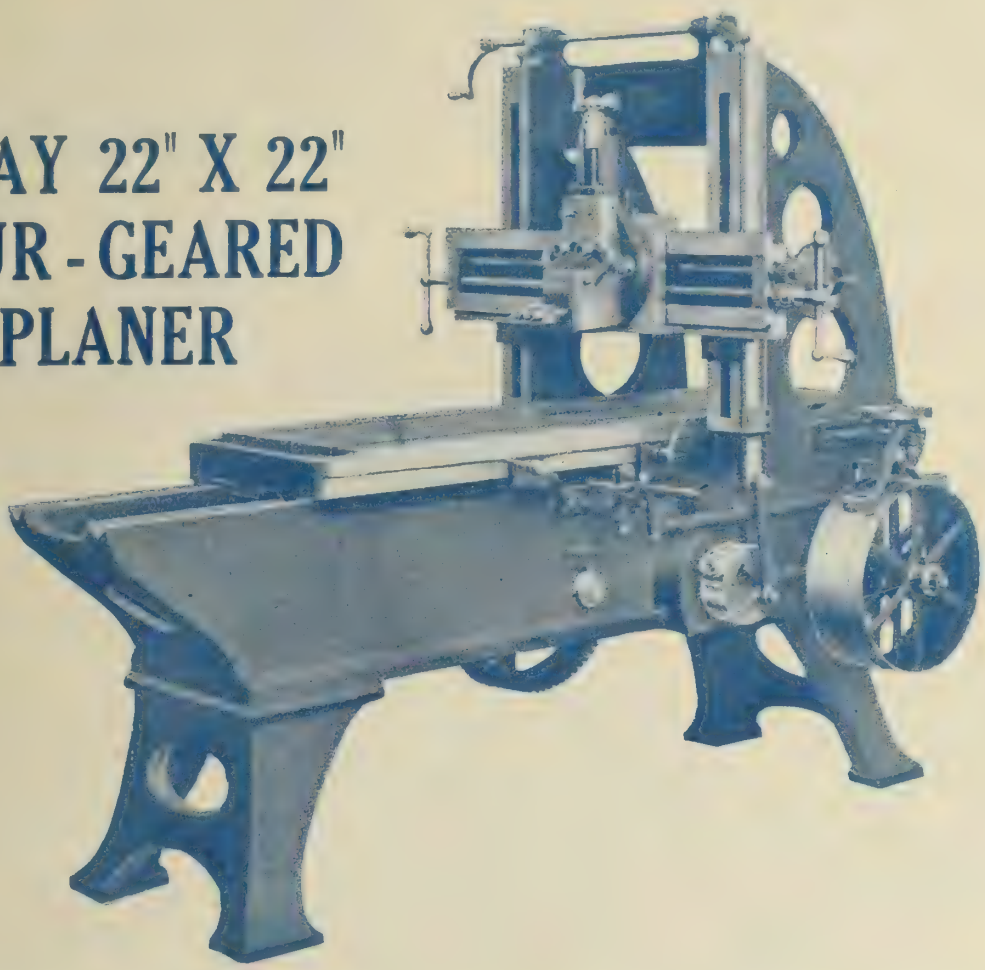
GRAY 22" X 22" SPUR-GEARED PLANER



Gray Planers are built by a firm that makes nothing but planers. They are given the entire time and attention of a large organization—and their performance shows it.

In designing this tool the parts have been so proportioned and the metal so distributed that the planer is quick acting and simple in operation, and yet sufficiently stiff, strong and powerful to perform a great portion of the work for which larger, heavier and more clumsy planers are ordinarily used. May we send you full details?

You can't help noticing the good qualities of Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.

The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point—on the face of the cutting edge. Sharpening in no way affects their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

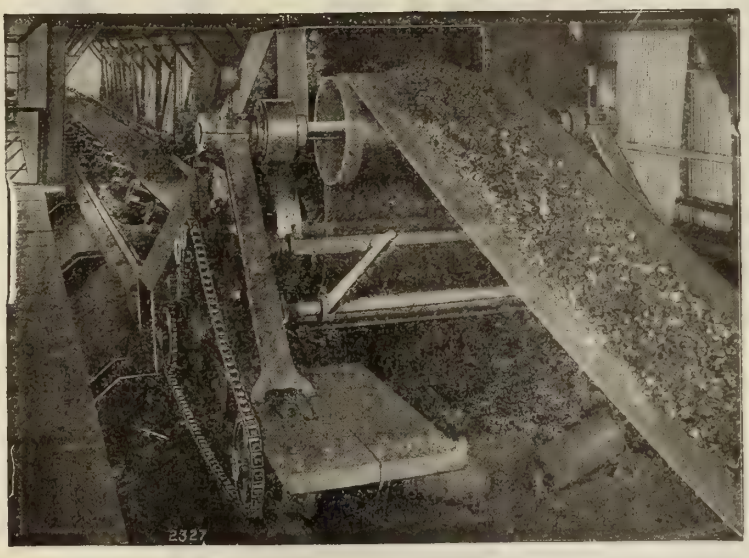
BELTING



SCANDINAVIA BELTING

HAVE you ever been disappointed in your conveyor belts by their opening up at the plies? This is one of the commonest reasons for failure in a conveyor belt.

Is there a remedy? YES. Buy a belt that is not built up in plies. Such a belt is

Scandinavia Belting

This is a solid woven belt, made of long stock cotton, and it is built to wear. We have just had reports from two large users saying that Scandinavia Belting gives them more dollars in value for handling materials than any other belt they had ever used.

Use it for conveying

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material. Motto: **"Quality and Service."**

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

HIGH VACUUM

Can be efficiently and economically maintained by the use of ER-1 Dry Vacuum Pumps.

They are made in both steam and power driven models and embody many valuable features not usually found in machines of this class, such as:

Totally Enclosed Construction
Automatic Lubrication
Heavy One-Piece Frames
Balanced Cranks and Flywheels
I-R Plate Inlet and Discharge Valves
Large Water Jackets

Due to their high speed and high volumetric efficiency, they occupy two-thirds less floor space than any other type of pump of the same capacity, and require only a very simple foundation.

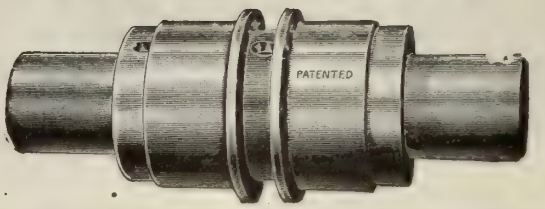
THE JOHNSON FRICTION CLUTCH

BUILT FOR LONG SERVICE



It takes time to do anything well, but the results usually justify the effort. Johnson clutches represent years of practice on one particular line. Our long experience in studying the demands of the trade, in refining our methods, in recording performances, and in selecting materials—all this is reflected in the present quality of our product.

Our engineers are at your disposal to help you with your clutch problems. Just send them your blue prints and they will do the rest. The Johnson clutch which they install will be correctly designed, properly rated, and honestly built. It will give that long and continuous service for which it is famous, and in which alone lies satisfaction.

FOR ROCK CRUSHERS

LEBANON STONE CO.
Lebanon, Pa.

Magnolia Metal Co. 6/16/19.
Dear Sirs:—

Referring to your inquiry as to our experience with your MAGNOLIA BABBITT METAL would say that the writer has used this material exclusively for a number of years for general purposes, but more particularly, and in the largest quantity, for Pitman Bearings on an 18 x 36 Buchanan Crusher. This service is very severe and as these particular bearings are difficult to get to, we took care to see that we got a durable metal. To illustrate—One crusher we have been operating almost continuously for eight years, and during that period have found it necessary to babbitt the large Pitman Bearing only twice.

The above has been our experience, and from that we unhesitatingly recommend your metal.

Yours very truly,
T. MEAURON, Treasurer.

Sold by Leading Dealers Everywhere, or

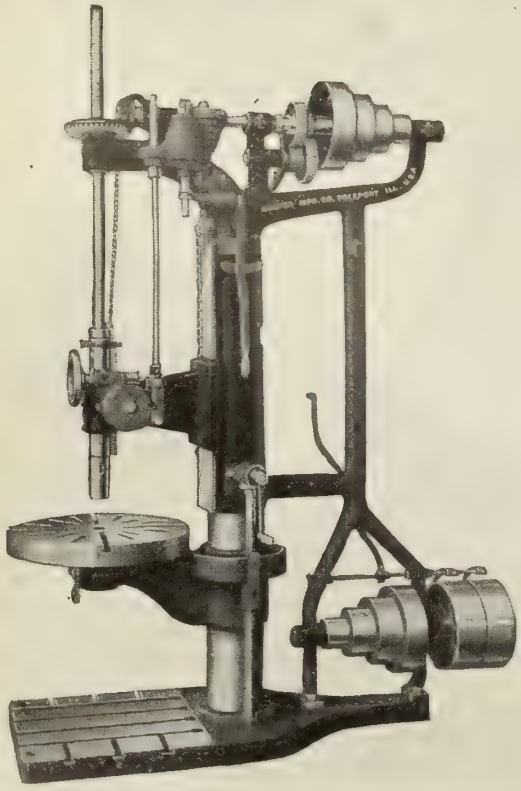
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

HOEFER MFG. CO.
FREEPORT, ILL.

AUTOMATIC MILLING IS ECONOMICAL MILLING

Machine is always cutting metal. While the attendant is loading one vise or fixture the cutter is milling work carried on the second table.

The finished work is never returned under the cutter, thus avoiding all marks or scratches on the milled surface.

We want you to know more about the wonderful possibilities of this automatic milling machine for your duplicate milling.

Electric

No. 3

Of a Series of Technical Talks on Ball Bearings

THE upper diagram opposite shows the comparative space occupied by plain bearings and SKF Bearings, and demonstrates the compactness of an SKF Ball Bearing motor. Babbitt Bearings are usually designed with the box length two and one-half to three times the diameter of the shaft which they support. Contrasted with this, the length of SKF Ball Bearings along the shaft usually is not over one-third of the shaft diameter. Surrounding the ball bearings is a lubricant chamber, which at its outside limits is one-half to one-third shorter along the shaft than the plain bearing for the same motor, with the results that the overall length of motors can be reduced 10 per cent. to 20 per cent. by the employment of SKF Ball Bearings.

Owing to the elimination of friction and consequently of wear the use of SKF Ball Bearings, prevents the armature dropping on the pole pieces, for after long service these bearings show no measurable wear and the original air gaps are, therefore, maintained. Air gap clearances can thus be reduced—an important consideration in induction motors, resulting in higher efficiency.

For the successful employment of SKF Ball Bearings, five general rules apply:

(1) Use judgment in the selection of bearing size. If in doubt as to the proper bearings to use, consult our Engineering Department.

(2) Use care in mounting bearings. Keep them free from dust, metal chips, etc., before sealing them in the bearing heads.

(3) Provide properly machined seats for the bearings on the shafts, and in the bearing housings.

(4) Provide around the bearings, lubricant chambers of such capacity and design that they will retain the lubricant.

(5) Use a lubricant which is chemically neutral, SKF Grease recommended. Do not destroy the highly polished surfaces of the balls and ball races by the use of an inferior grade of lubricant.

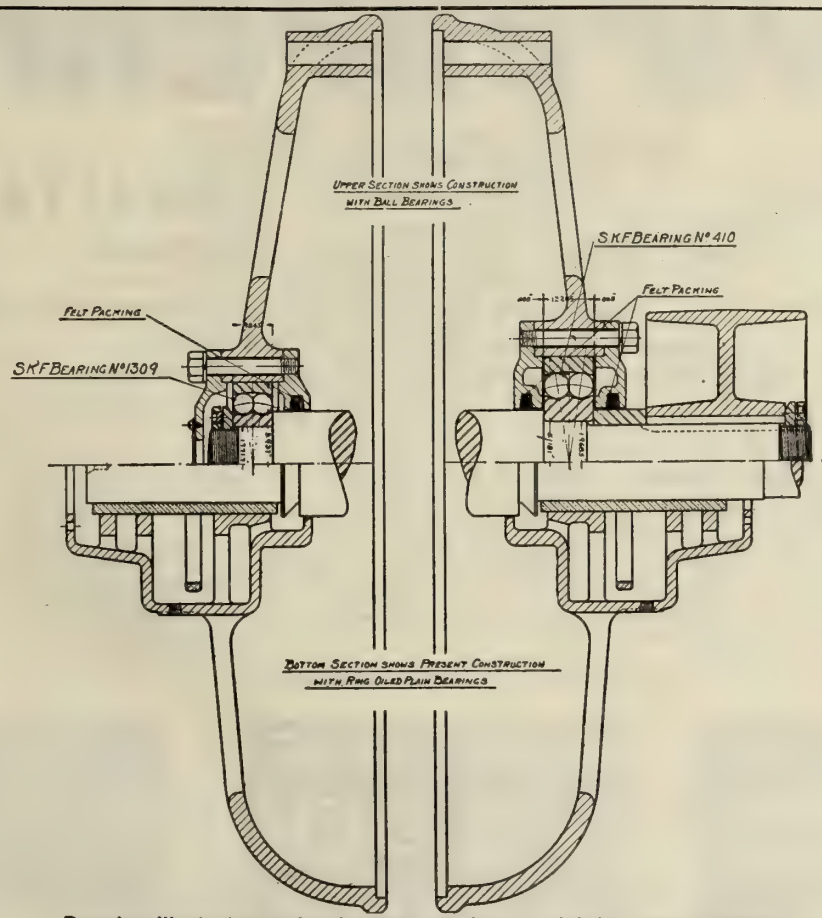
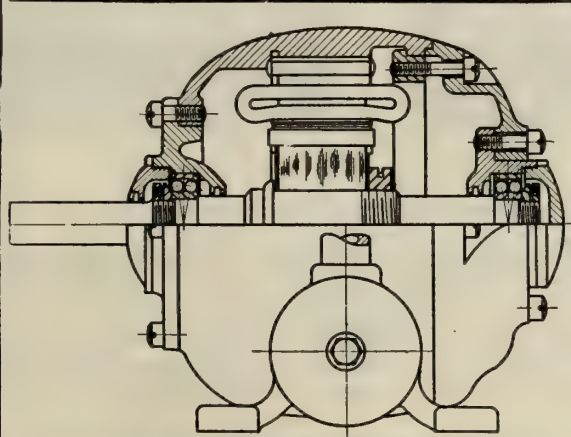
Motors

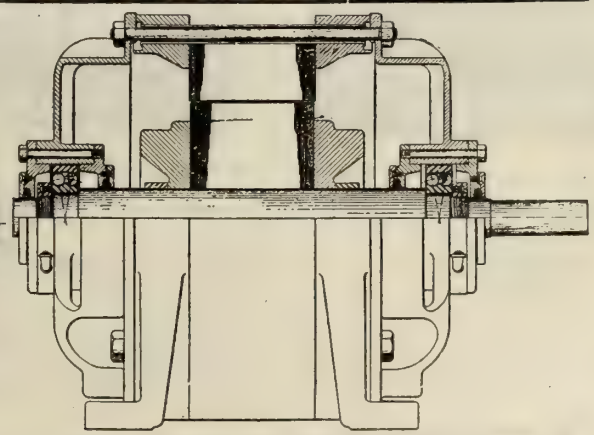
If you would like to receive reprints of these articles write us and we will put you on our mailing lists.



Drawing illustrates saving in space by the use of SKF Ball Bearings. Greater rigidity and freedom from vibration. Overall length of motor reduced 20 per cent.



Construction shown makes possible the removal of armature by simply taking out cap screws in bearing housings. The bearings remain on the shaft, and are not exposed to dirt.



Drawing showing the simple method needed to apply SKF Ball Bearings. No trouble from oil leakage. No change in air gap.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

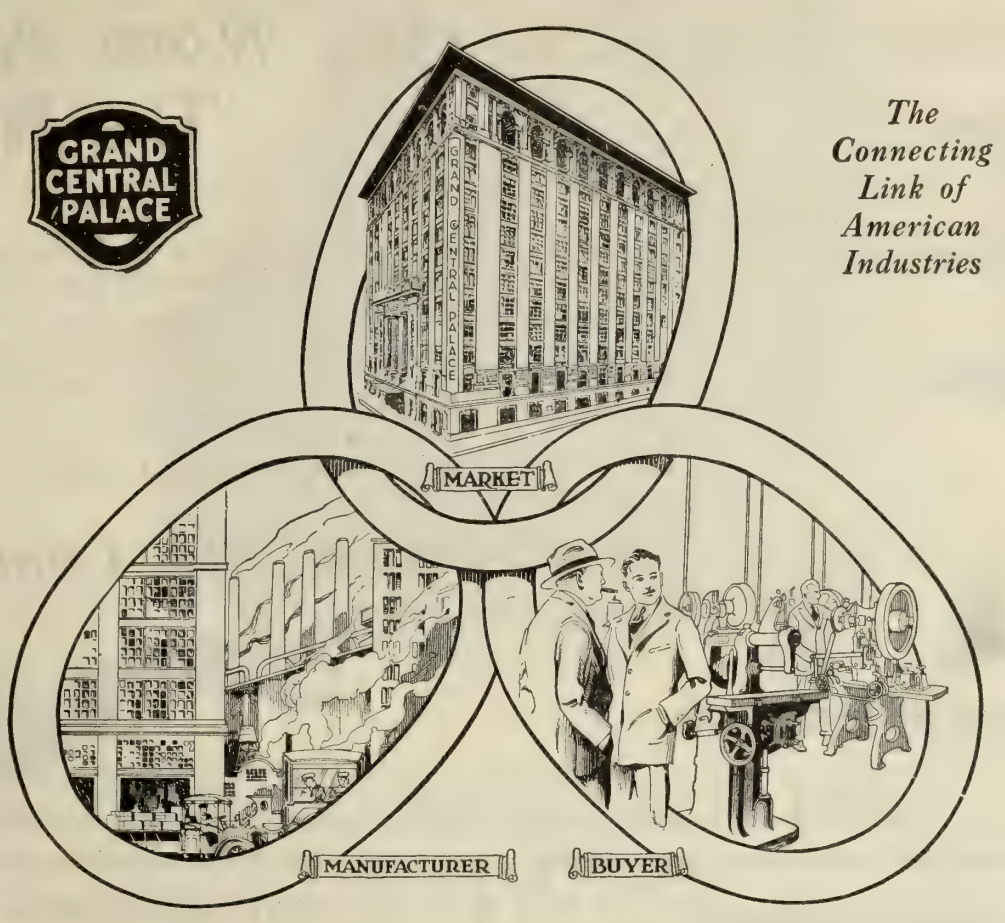
send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.
We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.

GRAND CENTRAL PALACE

The Connecting Link of American Industries



International Machinery Exposition

IN buying and selling much is claimed for "connecting links" of one sort or another—links between manufacturer and consumer. Now comes the strongest link of all—a proposition so sound, so logical, so progressive, that it commands your instant attention.

The INTERNATIONAL MACHINERY EXPOSITION will open soon in Grand Central Palace, New York. It is to be a huge clearing house where manufacturer and buyer will come into direct contact. It is to be one of the eight permanent industrial expositions in that largest of exhibition buildings, operated by the Merchants & Manufacturers Exchange, of New York. It will be visited by buyers, purchasing agents, engineers, jobbers and dealers from all over this country and foreign countries.

Here, side by side, will be arrayed all that is best and most modern in engines, lathes, milling machinery, drills, screw cutters, hand and power presses, boring, can-making, wood-turning machines, etc.

You will want to visit this mammoth Machinery Exposition, as well as the other permanent expositions in the Grand Central Palace. A wonderful opportunity invites the live manufacturer to place his products before the world's buyers. For information address:

International Machinery Exposition

Grand Central Palace, Lexington Avenue, 46th and 47th Streets, New York City

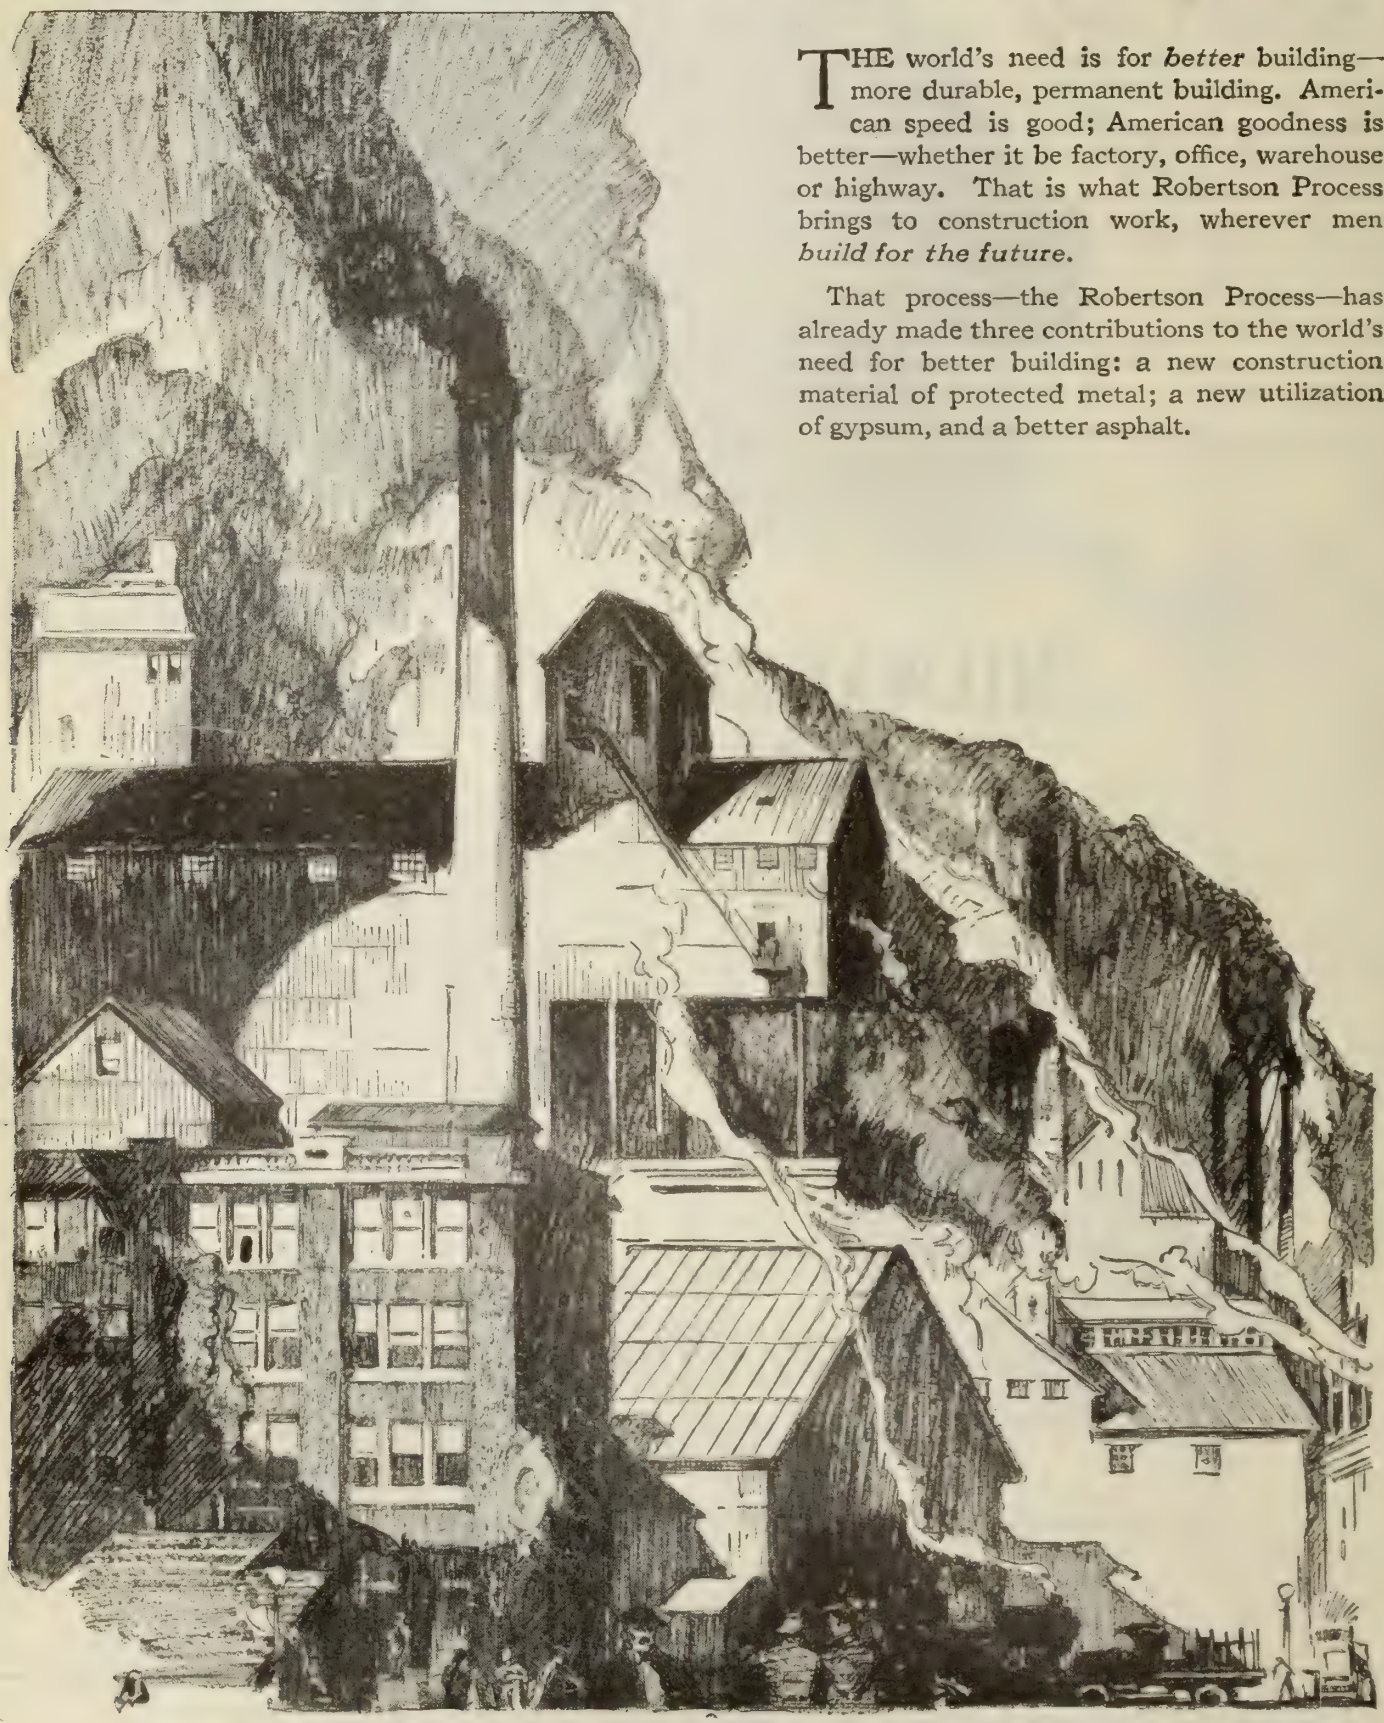
ROBERTSON
BUILDING PRODUCTS



THE world's need is for *better* building—more durable, permanent building. American speed is good; American goodness is better—whether it be factory, office, warehouse or highway. That is what Robertson Process brings to construction work, wherever men *build for the future.*

That process—the Robertson Process—has already made three contributions to the world's need for better building: a new construction material of protected metal; a new utilization of gypsum, and a better asphalt.

PROCESS HIGHWAY MATERIALS

TRADE MARK REG U S PAT OFF

METAL

Robertson Process, applied to metal is a method of protecting steel sheets, shapes and bars by means of a series of impervious coatings of asphalt, asbestos and water-proofing. It is a method of protecting metal from rust, corrosion and general deterioration caused by exposure to weather, smoke, gases and fumes.

Robertson Process Metal finds its greatest economical use as an industrial building material in roofing, siding, ventilators, skylights and general building trim where it quickly saves its cost in painting and repair.

GYPSUM

In Robertson Process Gypsum, one of the world's basic building materials has been given new and economical uses in building construction. By a method of scientific composition and reinforcement, gypsum has become a practical flooring and roofing material. In both poured and pre-cast form it combines the greatest possible strength with the lightest possible weight and effects savings in roof and floor costs as well as in the general structure of public, commercial and industrial buildings. Fire resistance, non-condensation, heat insulation—all inherent qualities of gypsum are fully utilized.

ASPHALT

This is another basic building material which has assumed greater world-wide usefulness through the application of Robertson Process. By a new method of refining it has been found possible to produce asphalt of a heretofore unknown quality and with greater economy.

This better kind of asphalt finds many practical uses in Robertson Paving Joints, Robertson Asphaltic Paints, Robertson Mineral Rubber and and many other building products and building materials.

Technical bulletins covering each basic product, or general booklet, "Robertson Process—Metal, Gypsum, Asphalt," will be sent upon request.

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 56A

Steadyrest Work Shoes

Many times we are asked why we use hardened steel shoes in some cases and wood shoes in other cases. It may be helpful to explain at this time the reason for these different conditions.

Normally, in the production of commercially ground parts in large numbers, the work shoe must be of such shape, size and proportions as to remain a constant factor in the grinding operation, because the operator is constantly turning out piece after piece at short intervals. If he had to take into consideration variation in size due to change in the work shoe, his production would be cut down materially. Therefore, the hardened steel work shoe of the size of the finished work for finishing, and of the size of the rough ground work for roughing, provides a means of supporting the work and removing one of the variables in the grinding operation, because the hardened steel work shoe retains its size longer and can be depended upon to produce parts of the same size, piece after piece, without consideration on the part of the operator.

Where a machine is used for general all-round grinding, when there are seldom more than one-half dozen pieces to be ground at one given time, it would be manifestly unreasonable to hope to have hardened steel shoes of the proper size for all the various pieces being finished. Therefore, a steadyrest with adjustable wood shoes is provided which has a range within the capacity of the size of machine being used, and can be readily adjusted to the diameter of work being ground.

Much discussion has been met with in connection with the use of hardened steel shoes because, it is argued, the work being ground is liable to be scratched. This has proved to be a false line of reasoning, and it is readily understood when one considers that the steadyrest shoes of soft material will pick up particles of dirt, abrasive, chips, etc., and retain them, really converting the shoe into a lap; and consequently the hardened steel shoes will not become imbedded with these particles so easily. Therefore, if it fits the work properly and is in line with the work, hardened steel is less apt to scratch than the soft materials.

In the case of hardened steel shoes it is very important that they be properly constructed and properly mounted in the steadyrest. The shoe must present a considerable portion of its bearing surface to the work being ground. It must be in line with the axis of rotation of work, securely fastened in the steadyrest, and properly hardened and smooth.

The other forms of steadyrest do not need such careful attention as the hardened steel for, since they are soft by nature, they quickly wear to a point where they meet all of these conditions. The fact that the hardened steel shoes do **not** wear so rapidly is the reason why they must have more attention in the making.

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

Vol. XXI. No. 12. September 25, 1919

How Do You Prepare Your Shop Photographs?

The Value of Shop Photography is Already Too Well Known to Need Comment. The Preparation of Such Photographs is, However, an Important Point to be Considered

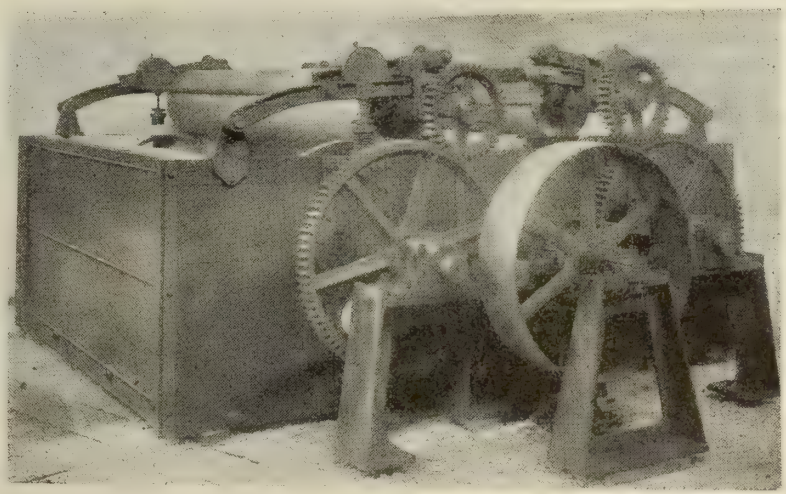
By F. A. McLEAN

PRACTICALLY every manufacturer of machinery, power plant equipment, or mechanical specialties today finds it necessary to occasionally have photos taken of his product, machine-tool equipment or plant, for advertising or reference purposes. In the United States there are many engraving and photographic concerns who make a specialty of this class of work, and fortunate indeed is the man who can secure the services of such concerns at moderate cost. Canadian firms doing this class of work are found only in the larger cities, and, as many of our largest Canadian manufacturing concerns are located in small towns, the cost of sending to the city for expert mechanical photographers is prohibitive in many cases and it becomes necessary to make the most of the means at hand.

In many shops it is customary to have the photos made by local photographers, and in this case it is necessary to give very clear instructions as to what you wish to have done, for it is well to remember that while most photographers are well educated and intelligent men, possessing more or less thorough knowledge of the technic of their craft, one cannot expect them to be advertising men and mechanical experts as well.

One large firm in the United States ran a contest to secure photos of their product—a device for use on planers, lathes, and milling machines—and although they spent several hundred dollars and secured many photographs, they were unable to use any of them, as none of the pictures secured brought out the merits of their appliance in the proper way. The method which they adopted was to send out a form letter to the users of their product, asking what their experience with it had been and asking such firms to have photos taken by a local photographer and charged to them, and, at the close of the contest, prizes would be awarded to those sending in the best pictures from an advertising point of view.

Many of the pictures which this concern received were splendid examples of the skill possessed by some of our small-town photographers, but practically none of them had been taken in such a way as to feature their specialty, and while they would doubtless have been of value to the makers of the various machine tools, the concern which should have reaped the benefit was out several hundred dollars with nothing to show for it.



PHOTOGRAPH TAKEN WITH MOVING WHITE SHEET IN BACKGROUND. NOTE THE ABSENCE OF WRINKLES.

Had this company gone into details and asked their customers to try and have the picture taken in such a way as to make a prominent showing of their device in operation, they would have been more successful.

To secure the best co-operation it is advisable to have the majority of the pictures taken by one photographer. Firms which have all their photos made by the ordinary small-town professional photographer will find it better to place all their work with one studio than to farm it out where they can have it done the cheapest, as the more often you have a man take pictures for you, the more familiar he becomes with the requirements of your work and the nature of and variations in the light which prevails in your plant, and consequently is able to render better service and is more likely to give you a higher grade of work and get it out quicker than when he knows that probably your next job is going to his competitor on the other side of the street.

If the photographer you employ does a considerable amount of amateur work, it will be a good plan to make it plain to him that your work must have special attention and care, for which you are willing to pay, rather than have it thrown into large tanks with a lot of amateur work, to be gotten out on a speed, rather than a quality basis. Should you require about the same amount of work in winter as in summer, it should not be hard to bring him to your point of view, as, during the winter time, a good deal of the amateur work slacks off and he will be more dependent on your work than in the summer time.

It is sometimes impossible to get a professional photographer to come to your plant when he is needed most, and if pictures are required frequently it will pay any concern to train one of their own staff to do some of this work. With the almost universal interest in amateur

photography at the present time, it should not be hard to discover amongst the employees of the draughting room or shop a man having some of the necessary qualifications for this work.

The Proper Camera to Use

Having secured a man to do the work, the next thing to consider is the camera, which should be either of the film or plate type, but preferably the latter, as films do not give as good a negative as plates for this class of work, and are not as easily handled should it be necessary to paint out some portions of the negative for any reason. Plates are less susceptible to temperature changes than films, but are more easily broken, and for this reason they should be kept in a vault when possible. It is a good plan to number each negative with India ink near one of the edges, and place them in envelopes on which is also written the date, number and title of the negative. Dates, numbers, titles and sizes of the negatives, should then be entered in a book or card index record.

The size of the camera to be used will depend on the average size of the objects to be photographed, the amount of detail required, etc. For the average shop a 5 x 7 or 8 x 10 will probably be the most suitable, as the cost of plates and prints for the 10 x 12 and larger sizes is high, and pictures made with cameras below 5 x 7 seldom contain sufficient detail to bring out the desirable points of a machine or mechanical device clearly. Retouching a 5 x 7 view of an object containing much detail is usually expensive and unsatisfactory. For such the 8 x 10 size is best.

The ground glass screen with which these cameras are fitted allows the object which is being photographed to be brought into much sharper focus than is possible with cameras equipped with finders alone, and this has a good deal to do with the ultimate quality of the picture obtained. The focus should be adjustable by a rack and pinion and the camera should have a rising and falling front to prevent distortion when photographing high buildings, towers, structural steel work, etc.

A well-constructed, rigid tripod, should be purchased with the camera, as a poorly-constructed tripod will often allow the camera to move when inserting plate-holders, withdrawing or replacing plate-holder-slides, etc., causing blurred negatives.

Before deciding on the type of lens to be used, it is well to obtain the advice of a reliable manufacturer of photographic apparatus, informing him just what you wish to do with the camera and relying on his advice in choosing the lens you will use. The old reliable rapid rectilinear lens will turn out some very satisfactory pictures, but some of the more modern types are much quicker and better adapted to operating in poor light.

If floor space is available and conditions warrant it a small dark room may be constructed and the pictures developed and printed on the premises, but unless a comparatively large number of prints are to be made it will probably be better to have this work done by a nearby professional photographer, who will unload and develop the plates, make the prints, and reload the plate holders.

Some firms build machinery for which the demand is too small to warrant the expense of having half-tones made for use in the publication of descriptive literature and when this is the case photographic prints or blue prints made from the negatives will be useful. A number of prints of this nature may be mounted on sheets (with little stickers called Art Corners) with neatly lettered descriptive captions under each print, and the whole bound into a book for the use of the sales force. Small booklets may be gotten up in a somewhat similar manner, using mimeographed sheets interleaved between the prints to carry the sales message or description of the product.

Photos of Set-Ups

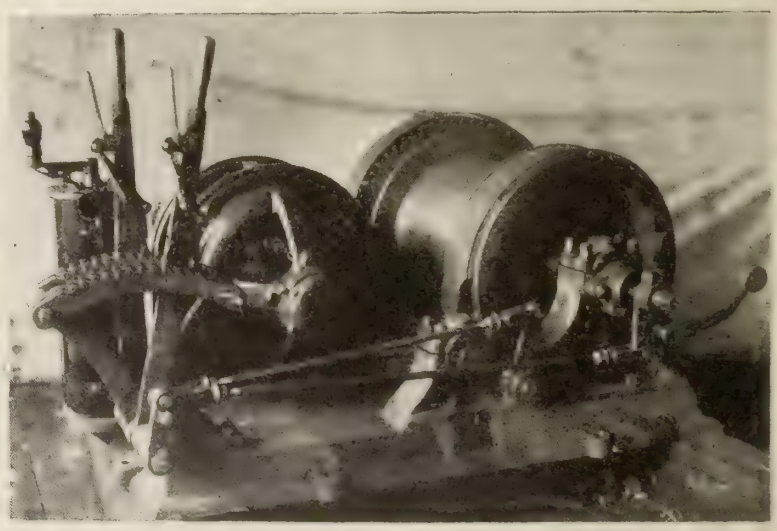
Photos of the tooling set-ups for certain jobs will often be found of value to a mechanic who is called upon to handle a certain job for the first time, and it is also useful at times to have photos made of the assembly of special machines which are being made for the first time and for which there is some likelihood of having repeat orders. These photos will save considerable time if for any reason the men who assembled the first machine are not available.

In the production of half-tone engravings, the cost of retouching is usually one of the largest items, and any method which will eliminate some of this cost by reducing the amount of retouching required is well worth application. It is often possible to do away with some of the retouching required by properly preparing the machine before having the photos taken. One of the first points to be considered is the painting of the machines which are to be reproduced; if they are painted a very light color and a light background is used, the outlines of the machine will be hard to distinguish from the background, and will require retouching to make them stand out properly, and if a very dark paint is used and the background is naturally dark, a considerable amount of detail will be lost and will have to be painted in before a good half-tone can be produced. In either case the retouching will be difficult and expensive. Even with a comparatively light background in the rear of the machine many small parts of the subject which have as their background the main body of the machine will not come out clearly if the machine is painted a very dark color. Dark slate-colored paint, made from white lead and lamp black and mixed so as to dry without gloss is the most satisfactory. Some painters add blue, but this is misleading and has the effect of lightening the tint in the photograph.

When taking photos of machinery in the average shop it is customary to place a sheet of white cloth behind the object being photographed in order to cut out some of the extraneous light and to provide a light background against which the outline of the object being photographed will appear in strong relief. After this sheet has been used a few times it becomes very dirty or spotted, and as these spots sometimes show in the finished print they have to be painted out in order to prevent them showing in the engraving.

If this sheet is large enough to clear the range of the lens on each side of the camera and it is kept in constant motion while the exposure is taking place, it will be found that the print will be sharper and the dark spots and wrinkles which had very often to be painted out when the cloth was held stationary have entirely disappeared.

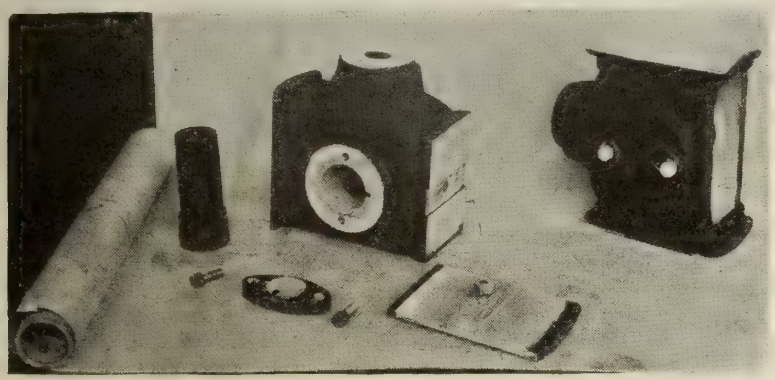
When the machine rests on a dark floor it is a good plan to spread sheets of white paper on the floor around its base to lighten the background and reflect the light. Sometimes sheets of paper are not readily obtainable, and in this case flour, sawdust, or shavings will accomplish much the same result, although the latter will require some painting out.



PHOTOGRAPH TAKEN WITH STATIONARY WHITE SHEET IN BACKGROUND NOTE THE WRINKLES AND DIFFERENCE FROM THE ONE ON PRECEDING PAGE.

Watch These Points

When it is desired to have cap screws, nuts and bolts, or letters on a casting, etc., show up strongly, they should be rubbed with chalk or coated with a thin covering of white lead. Lettering figures, etc., may be painted in white on the machine, as is done by many makers of tanks and steel plate work, and will show up very well. Where a number or descriptive matter is to appear in an engraving it may either be cut into the finished plate by the engraver or painted on the photo by the retoucher. A scheme used by at least one large Canadian maker of machinery is to have a small board on which is painted the name of the machine, firm, or any other matter desired, and this board is placed near or against the machine being photographed in such a way that the lettering will appear clearly in the finished print. This method is particularly adapted for making up sets of photographs or blue prints for sales purposes, or draughting room use.



THE DANGER OF MAKING CERTAIN SURFACES TOO LIGHT IN COLOR. NOTE THE FACT THAT SOME SURFACES ALMOST MATCH WITH THE WHITE BACKGROUND. THIS IS AN OBJECTIONABLE FEATURE.

It is sometimes desirable to take a picture of a machine or device in operation for advertising purposes, and here the shop photographer has advantages over the commercial studio as he is not liable to picture a man wearing a silk hat at work on a lathe, or some other equally ludicrous combination which one sometimes sees in the efforts of some advertisers to secure atmosphere for their advertisements. One point which should be watched, however, is the pose of the machine runners, riveters, miners, or whatever they may be, as it is one of the failings of mankind from childhood to try to appear at their best when having a picture taken, and unless this posing is carefully watched some very unnatural pictures will be the result. Many men will want to look at the photographer or camera instead of at the machine they are running, or at the work they are supposed to be doing, or they will assume a rigid position when they should be relaxed, etc. It is sometimes possible to get a picture of a man at a machine in operation without the operator knowing that it is being done, and, while there is always danger of the man moving and spoiling the picture, it is sometimes possible to get a picture in this way which cannot be obtained in any other. Occasionally it is possible to fool the subject by pretending to take the picture, leaving the actual exposure to a more favorable moment.

The illustrations used in the Norton grinding machine advertisements are one of the best examples of what may be done in the way of securing good pictures of machine tools in use.

Retouched photos may be filed in folders having a proof of the cut pasted to them and placed in vertical filing cases for storage. A simple numbering method may be arranged by numbering the pages of a blank book from 1 to 1,000 or as high as required, entering the description of the first photo taken with its size, number of prints, size and number of half-tone and electrotype made from it, and where the photo and cuts are kept, etc., on the first page. This scheme may be varied to suit different conditions.

Illustration for part lists, etc., can be made by fastening the parts to a board covered with light-colored paper, on which is marked under each part, its serial number, or these may be painted on the photo when it is retouched. Care should be taken to see that the parts are so distributed that they will not interfere with each other and that one piece does not rob its neighbor of the light necessary to make it show up properly.

In taking pictures in the shop, it will generally be found better to use the smallest stops on the camera with correspondingly longer exposures than those required for the larger openings, as the pictures with the smaller stops will be much sharper.

Study the Details

Care should be taken when arranging machinery which is to be photographed that all small parts such as oil cups, pipe fittings, etc., are properly screwed in place, as any misalignment in these small details looks very bad in the finished engraving. In one case of this kind which came under my observation, a large globe valve was not screwed on straight, and this point was not noticed until half-tones had been made and work started on a catalogue in which this half-tone was used. When the printer sent back the first proof this defect came to light and the printing had to be held up while the retouched photo was sent to the engravers to have this defect rectified and new plates made, at an additional outlay, whereas, had a little attention been paid to this point in the first place everything would have been all right.

Sometimes oil holes or threaded openings in some classes of machinery are plugged with corks or wooden plugs to protect the machine from dirt and moisture during shipment, and where this is the custom the shop photographer should be cautioned against forgetting to withdraw these plugs before making the exposure, as otherwise they will have to be painted out on the print and sometimes threads or other matter painted in. The cleaner the shop is at the time the pictures are taken the better, and when views of a number of small machines are to be taken, they should be arranged in neat rows when possible as they will look better than when scattered around any old way.

Generally speaking, the object to be photographed should be lighted from the upper left-hand, but in a crowded shop and with large machines, it is seldom possible to arrange this as it should be and all that can be done is to choose that time of day when the light will be most favorable, avoiding as much as possible having the camera face strong light from shop windows, overhead monitor or saw-tooth roof, or if this cannot be avoided the light should be blocked off by sheets of cloth or paper if time will permit.

Considerable judgment may be exercised in the choice of the point of view, especially when photographing large machines, selecting such locations as will show the greatest number of important features and avoiding positions which will result in an unbalanced or distorted effect. Correct judgment or good taste in this respect is generally the result of experience, and no general rule can be laid down. As an instance of what is meant, it is best to photograph cross compound engines or compressors from the high pressure side. If taken from the low pressure the difference in cylinder diameters is exaggerated and the effect is unsatisfactory. It is always safe to check the finished machine over before exposure and see that all parts have been assembled, that all operating levers, etc., are in correct position, and if necessary have the machine turned over until all moving parts are in the most effective position as regards appearance.

The application of commercial photography in the machine tool and manufacturing industries is too large a subject to be fully covered in a short article of this kind, but if a little attention is given to the foregoing suggestions it will be possible to secure some very good pctures at a reasonable cost.

The second course of the table d'hote was being served. "What is this leathery stuff?" demanded the diner. "That, sir, is filet of sole," replied the waiter. "Take it away," said the diner, "and see if you can't get me a nice tender piece from the upper part of the boot, with the buttons removed."—San Francisco Argonaut.

Plant of the Hull Iron and Steel Foundries

A COMPREHENSIVE story of the business from its inception up to the present, including the system of recording and cost keeping.

By F.H.B.

BIRD'S-EYE VIEW OF THE "HISCO" PLANT OF THE H. I. & S. FDY.

THE Hull Iron and Steel Foundries, Limited, whose works are shown in the accompanying illustration, is an establishment of which its promoters and founders are justly proud. As its name would imply, it is essentially a foundry, although a machine shop of no mean proportions accompanies it. As its name also implies, its products are both of iron and of steel, although the steel predominates.

Grey iron foundries are not an uncommon part of the make-up of most every industrial centre, and the grey iron department of this plant is practically a duplicate of other foundries which are equipped for doing heavy work. The melting capacity of this department runs into tons and the equipment consists of enormous cupolas and ponderous cranes. With the foundry specially equipped, as it is for doing large work, they have no particular advantages in the way of doing small castings, and do not cater to that trade, but for such castings as fit their capacity they take second place to none, and are prepared to fill orders for grey iron castings of very large dimensions.

The Steel Foundry

It is to the steel foundry branch of the plant, however, that we will pay particular attention on this occasion. Although not built for a munition plant or in any way as a war-time necessity, it appeared on the steel producing horizon at a most opportune time and did much toward deciding the issue and winning the goal toward which all were struggling.

In the year 1913, when times were not any too good in any line of business, when in fact many industries were working with very reduced staffs and hundreds of workmen were in idleness, Mr. A. H. Coplan, of Ottawa, with a keen eye to business, saw an opening for just such a business as this, and with characteristic determination and enterprise succeeded in completing the structure and getting it in first-class running order at just about the time of the beginning of hostilities. The war did not bring much business to Canada at first, but on the contrary, it added to the depression; however, in no time it was found necessary to call upon Canada for supplies other than foodstuffs and while our machine shops were found to be of inestimable value in the production of shells, etc., the foundries, particularly the steel foundries, were also called upon to produce enormous tonnage of steel castings, with the result that the Hull Iron and Steel Foundries found themselves very busy and getting busier. In fact, it was found necessary to strain

MODERN STEEL FOUNDRY PRACTICE HAS BEEN SO PERFECTED THAT TOP POURING CAN BE DONE SUCCESSFULLY ON MANY LINES OF WORK.

every muscle in order to meet demand for castings, and many additions were added to the plant as a consequence.

Now that the war is over and the country is calling for such lines as were neglected for so many years, the experience gained during the war, particularly in making goods which would pass the rigid examination of the munition board and also in producing the maximum output in the shortest possible time, places them in an enviable position for filling large orders, particularly of large castings, on surprisingly short notice.

It must not be inferred from this, however, that the experience gained during the war is all they have to fall back upon. The company was very fortunate in securing the services of Mr. A. Baillot as foundry superintendent. Mr. Baillot is a thorough master of the steel foundry business, having had exceptionally wide experience in Belgium and France, especially in Paris, France, and this, along with the experience of the last six years, places them where they are to-day.

Unlike many plants of the mushroom order, which sprung up as it were during the night in order to do munition work, and which suspended operations as suddenly as they began on the conclusion of peace, the Hull Iron and Steel Company never even slacked down, but on the contrary are busier than ever and are at present making extensive additions.

Present Capacity

The present capacity of the foundry is 600 tons per month, and the equipment consists of electric as well as open-hearth furnaces, ordinary foundry cupolas and Trapman Converters. They are also well provided with annealing furnaces and drying ovens, in addition to special equipment for heat-treating manganese steel castings.

Special Features

A unique feature of this plant is that they can produce practically all of their own raw material. With the aid of the electric furnace steel turnings make ideal raw material, while wrought or even cast turnings can be used if so desired. It has also been demonstrated that first-class metal can be produced direct from the crude iron ore. Of course, none of the metal procured from any of these sources is poured into steel castings. This metal is poured into pigs, after which it is tested and analyzed for carbon, silicon, sulphur, phosphorus, etc., and graded accordingly.

Moulding Equipment

In the moulding shop the equipment includes pulley and gear machines for work up to fifteen feet in diameter and electric cranes capable of handling castings of this size, in addition to the regular run of foundry requisites. Another interesting operation for which they are well equipped is that of heating and compressing certain castings in order to make the grain more dense and sound.

Sure of Quality

Steel castings are not ordered in the manner so commonly in vogue in grey iron foundries, where the principal requisite is that they be soft. Steel castings are ordered to be made to specified chemical content as well as physical strength, and from every batch of metal used test bars are poured which are analyzed by a competent analyst, and physical test taken on powerful testing scales. The company has both the physical testing apparatus and compiete testing laboratory of their own in charge of F. H. Young, a practical chemist and metallurgist. A view of the laboratory is shown in the accompanying illustration.

Additions Under Way

At the present time two additional buildings of large dimensions are under construction along with some smaller ones. One is a complete two-storey pattern department remote from the main building, with five bays downstairs and six upstairs. These bays are separated from each other by automatic fire-proof doors, in fact, the entire building is to be as near fire-proof as man's ingenuity can devise. One large bay is to be equipped with machinery and tools for doing pattern work, while the remaining ten will be for pattern storage purposes. The other building will be a modern machine shop equipped with tools for keeping the shop equipment in order, and also for machining such castings as have to be machined before shipment. Many of the castings turned out of this foundry are of such proportions that few machine shops could handle them. Among the tools in the present machine shop might be mentioned a boring and turning mill capable of handling work 75 feet in diameter, and other machines of equally large proportions.

Undoubtedly the grandest feature of the entire business is its "system." System is certainly the keynote of success, and system has certainly played its part in the successful upbuilding of this business.

Calculating Recorder

Probably the most interesting feature of the entire "system" is the Bishop Electric Calculating Recorder, by which the actual cost of producing a job is recorded in the office by the workmen in the shop. To describe this in detail would be a greater undertaking than an article of this kind calls for, but it will be interesting to note that every pattern which is brought to the shop is registered and given a number. This pattern is placed in the pattern vault and its location is registered. When any pattern is wanted, it can be located instantly. When the pattern is given to a moulder, he does not have to leave his floor in order to register the minute he began work on it and when he finished it, by a simple movement on his part. he lets the office know what pattern is being moulded, who is moulding it, and how long he took to mould it. So complete is the system of recording that it is quite possible in answering a long distance call to tell at once just how any job is progressing, which jobs are being done, how many are completed, and how many are being done per day.

TESTING LABORATORY OF THE HULL IRON & STEEL FOUNDRY, LIMITED.

The output of this business consists of locomotive wheels, bridge work, crane castings, railroad contracts, in fact, all kinds of steel castings of whatever chemical content is required.

Mr. A. H. Coplan, the founder of the business, is president and general manager, and Mr. F. H. Cross is assistant manager.

DON'T TINKER WITH ECONOMIC PRINCIPLES

Lowering the standard of living by artificial methods makes for popularity, but this course ignores economic principles, thus setting aside temporarily the law of supply and demand. But, back of all is that economic law which grows out of the experience of years and which, in the end, will prevail. Governments, and more especially those recently engaged in war, have borrowed heavily under inflated conditions. It would seem unreasonable to expect that there would be any attempt to meet the interest obligations on such indebtedness contracted under inflated conditions out of taxes to be raised under a deflated condition.

Such being the case, it would appear to be sound business to expect the Governments to refrain from any drastic measures to bring about a general widespread deflation until the public debt had been cared for in permanent form on a basis where the revenues from direct taxation under a moderate revenue law would be ample to meet the interest charges and provide the necessary sinking fund.—Continental and Chemical National Bank, Chicago.

EXCHANGE NO FACTOR IN BASIS OF TARIFF

Ottawa.—The Customs Department has had many requests from importers that, in view of the fact that the British pound sterling has heavily declined, this should be taken into consideration when Canadian importers pay customs duties on imports from Great Britain. The practice is that they pay on the par value of $4.86. They believe that they should be given the benefit of current exchange.

The Customs Department points out that the practice is fixed. The matter of exchange is not taken into consideration as the value of the pound sterling is fixed by the Currency Act of Canada as compared with the dollar. Officials claim there is no injustice to the importer, as the goods he imports are worth at the rate of $4.86 2-3 in Great Britain, and under the customs law goods are valued at the time and place whence they are shipped direct to Canada. The importer gets sufficient advantage in the favorable rate of exchange.

The matter has been up for consideration several times. The practice is the same in the United States, the valuation for customs purposes there being $4.86 2-3, as here. The department has refused to entertain all requests to accept payment at the exchange rate.—T.M.F.

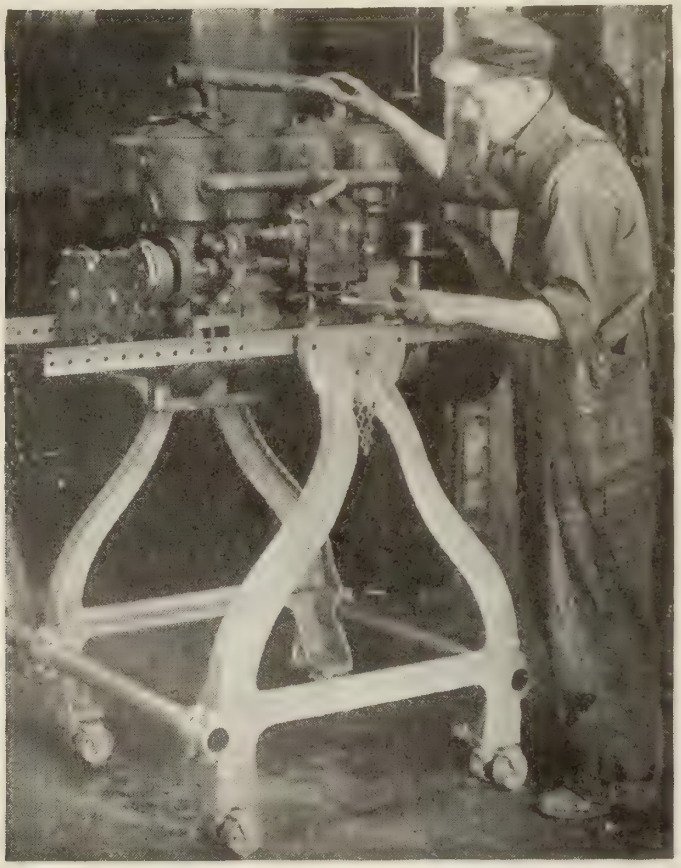
A Novel Gasoline Motor-Assembly Stand

By FRANK C. PERKINS

THE accompanying illustration shows a novel gasoline motor stand developed at Knightstown, Indiana.

It is held that this motor stand will handle any motor from that in the smallest passenger car to the largest truck and tractor motor. It is instantly adjustable to any width from 0 to 30 in., and in height from 32¼ in. to 39¾ in. The motor is placed in the stand in the natural way—the same way that it is placed in the car.

The side rails of the stand compare to the frame or sub-frame of the car.



VIEW OF THE STAND IN USE.

After the motor has been clamped in the stand it can be turned to any desired position and locked there by means of a small steel pin. This pin is attached to the stand by a chain and cannot be lost. The motor can be completely inverted so the lower crank-case may be readily removed, and the bearings exposed in such position as to be very easy to get at, and bearings may be scraped in and rods lined up with ease.

It is maintained that in motor assembly this stand meets every requirement, with no obstructions to the mechanic. All parts of the motor may be reached with the minimum amount of waste effort. In progressive or individual assembly, after the crank-case has been fastened to the stand it is not changed until the motor is ready to be removed. It is portable and is particularly adapted to speed up the work and keep all men busy.

A Ford attachment was designed to facilitate the assembly and repair of the Ford motor, the peculiar construction of which makes it impossible to handle this work in the same manner as the ordinary type of motor. This attachment securely clamps the cylinder block to the motor stand in such position that the Ford crank-case, transmission, crankshaft, flywheel, magneto, connecting rods, pistons and cylinder head can be removed without rearranging the cylinder block in the stand. This makes it possible to tear down a Ford motor and leave only the cylinder block in the stand, as is shown in the lower illustration

These stands are regularly equipped with double wheel castors which enable the stand to be moved from place to place with ease. In motor assembly the crank-case may be clamped to the stand and all parts of the engine assembled in the motor room. The stand, with the completed motor, may then be taken to the chassis department, where the motor is removed and placed in the chassis, and the stand is ready for another motor. In repair the motor can be removed from the car and be immediately placed in the stand, after which it can be removed to the motor room for repairs, and when ready to install again the motor stand conveys it back without removing the motor from the stand.

A man from the north of Scotland was on a holiday in Glasgow. On Sunday evening he was walking along Argyll Street when he came upon a contingent of the Salvation Army, and a collection-bag was thrust in front of his nose. He dropped a penny into it.

Turning up Queen Street, he encountered another contingent of the Salvation Army, and again a smiling "lass" held a collection bag in front of him.

"Na, na!" he said. "I gied a penny tae a squad o' your folk roon' the corner jist the noo."

"Really?" said the lass. "That was very good of you. But, then, you can't do a good thing too often. And besides, you know the Lord will repay you a hundredfold."

"Aweel," said the cautious Scot, "we'll jist wait till the first transaction's feenished before we start the second."—Tit-Bits.

IT WAS TIME

A preacher at the close of his sermon said: "Let all in the house who are paying their debts stand up." Presently every man, woman and child, with one exception, rose to his feet.

The preacher seated them and said: "Now every man not paying his debts stand up." The exception, a careworn, hungry-looking individual, clothed in his past summer's suit, slowly assumed a perpendicular position.

"How is it, my friend," asked the minister, "you are the only man not able to meet his obligations?"

"I run a newspaper," he answered, "and the brethren here who stood up are my subscribers, and—"

"Let us pray," exclaimed the minister. —Exchange.

Did you ever realize that every time you grumble you are making connection with the grumbling currents from other grumblers; that every time you find fault or scold or nag, that every time you show a mean, nasty disposition, you are making connection with vibrations from others along the same line?—"Success" Magazine.

Holding Devices Used on Jigs and Fixtures

By ROBERT MAWSON

ALMOST every modern machine shop uses some jigs or fixtures to obtain intensive and interchangeable parts for manufacturing.

In the larger plants a special department is maintained, where these special tools are designed. Under such conditions some system may be followed when designing the details which are used in the tools.

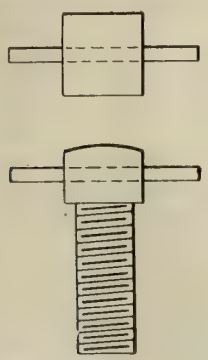


FIG. 1.

However, in the smaller shops, where only a comparatively limited number of jigs and fixtures are used, the work of designing is carried out either by one of the machine designers or draftsmen, or more often, by the tool room foreman, or one of the tool makers.

Under these latter conditions very little thought is given, as a rule, to provide tools according to any system of interchangeability of details. It will sometimes be found that on a fixture or jig the various bolts or screws are made of different sizes. This means, of course, nuts of different sizes, and the consequence is that the operator of the tool must use a number of wrenches when tightening the fastenings to hold the piece being machined in the tool.

This entails a loss of time, for the bolts should, whenever possible, be the same size so that only one wrench is necessary.

It is, however, advisable to avoid the use of any wrench, as under such conditions the tool is made quicker acting.

One method by which this can be done, and which is often used is to make the screw with a head, of larger diameter than the body of the screw, whenever possible, and having the periphery of the head knurled, the disadvantage of this holding device (which is at best unsatisfactory to use) is because when the man's hands are greasy, which is usually the case, sufficient pressure cannot be brought to bear on the screw and also by frequent use the fingers of the operator become sore by reason of the knurled surface.

One way to overcome these objections is afforded by making holding screws as shown in Fig. 1.

This is a very simple medium, being a standard or stock screw, either square or hexagonal head, with a pin forced into the head as illustrated.

This method overcomes the objection of using a wrench, but it is found that it is also hard on the operator's hands, the small pins being uncomfortable to the man when used frequently. The device shown in Fig. 2 was designed to meet the demand and it has been found to "fill the bill."

These knobs are made of malleable iron castings to provide strength and also cheapness, and as illustrated, are made with four wings formed on an arc and terminating into a boss at the rear.

The wings afford a convenient and easy hold for the hand so that the man can exert suitable pressure for any desired case.

A hole can be machined in the boss so that a turned portion of the screw can be forced into it and held by a pin placed at right angles. The screw is then integral with the knob and can be used in a manner similar to a bolt, or set screw.

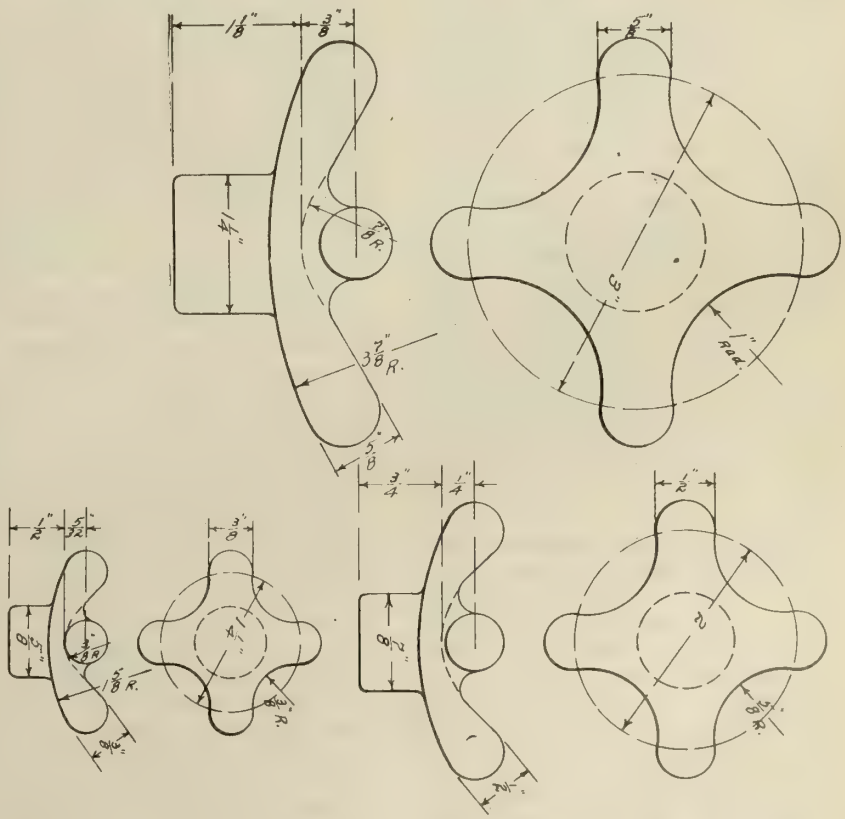
The knob can be threaded if desired and used as a nut on a threaded stud. The knobs are made in three sizes, and the dimensions given.

With these sizes the knobs are applicable to all types of jigs or fixtures, from the smallest to the largest.

A further advantage may also be noted. Namely, that these elements being carried on hand in the tool room, enables the fastening screws to be made much cheaper as it is only necessary to chase a straight piece of steel for the thread and turn down the end to suit the hole machined in the knob.

This is much cheaper than turning, threading and knurling a large diameter of steel to make a knurled head pin or screw. We have found such success with the device, both cheapness, quickness and satisfaction to the operator that they are now being used on all our special tools, superseding all other types of holding screws.

The number of the knob, either 1, 2 or 3, is usually cast on top of the casting, so that when calling for one on a design it is only necessary to mark on drawing say "knob No. 3," and the tool maker knows what is required and asks for it from stock.



KNOBS NOS. 1 TO 3.

The Strength of Screws, Bolts and Nuts

In His Memorandum to the Manchester Steam Users' Association the Author Gives Some Interesting Data Regarding These Much Discussed Items of Mechanical Design

By C. E. STROMEYER

IN my last year's Memorandum I mentioned that this subject was receiving consideration, but, with the exception of a few failures, which have occurred in the meantime, no practical enquiry into this subject had been carried out. The subject was dealt with in a paper read at the Spring Meeting of the Institution of Naval Architects. It was there shown that very slight irregularities in the shapes of screw threads, and more particularly in the relative pitches of screwed bolts and nuts, could produce very serious local stresses at the roots of the threads, stresses which were found to be far more intense than the overall tension stresses in the core of the bolt. It was also found that the finer the threads the intenser the local stresses, and that, contrary to the generally accepted view, a bolt with a fine thread and, therefore, with a relatively large core is no stronger than a bolt with a coarse thread. In fact, this conclusion is almost self-evident, if, as an extreme case, we look on the bolt head as being a nut with microscopically fine threads welded together in order that they may not become disengaged. Of course the corner between the bolt and the imaginary nut would be a mathematically sharp one, and, as is well known, a sharp corner is very weak because, as would happen if a microscopic thread had actually been used, all the shearing stress is concentrated close to the corner. It follows that a bolt with a microscopically fine thread is a very weak structure. The other extreme case is a bolt with such deep threads that it has no core, a mere cork-screw. Such a bolt would also have very little strength; but there is some intermediate ratio of depth of thread to diameter of bolt for which the strength is a maximum.

Unfortunately, this maximum has a comparatively low value, being about one-third of the strength of the shank of the bolt measured over the threads. This, no doubt, accounts for the comparatively low stresses which are allowed in bolts. For instance, the permissible stresses on boiler shell plates between the rivet holes reaches 13,000 lbs. per square inch, and still leaves an ample margin of safety, whereas 10,000 lbs. on the cores of bolts, or about 7,500 on the shank of a bolt is considered fairly high. In reality the local stresses at the roots of the threads, combined with the longitudinal pull of 10 000 in the core, works out at about 20,000 lbs. per square inch, and it is probably only due to bolt materials being very plastic, and the threads being very small structures and, therefore, capable of adjusting themselves, that nominal stresses of 10,000 lbs. corresponding to actual local stresses of 20,000 lbs. do not result in failures.

These local stresses can be greatly intensified by making the pitch of the nut finer than that of the bolt and this malpractice is a not uncommon one. Most bolts have their threads cut with dies, and when these get blunt they tend to lengthen the bolts while they are cutting and compressing them. Then also large bolts and nuts are turned in lathes, and when these have seen much service, the leading screw has become more severely worn near the headstock where the nut would be turned than further off where the bolt thread would be turned. The result seems to be that many large nuts have finer threads than their bolts. The result is that when these bolts are loaded, it is only the threads near the lower end of the nuts which carry the load, and the severe resulting local stresses combining with the longitudinal pull, which is also a maximum at this level, produce very severe stresses; so intense indeed that no simpler means for breaking off a bolt end could be devised than using a hard steel nut with a relatively fine thread and wrenching off the bolt end.

Conversely a very marked reduction in the stresses near the lower level of the nut can be effected by making the nut thread of a slightly coarser pitch, say one-tenth per cent., than that of the bolt. When the nut is screwed on and a pull applied, the bolt will at first rest only on the upper threads of the nut, and gradually, as the load is increased, the bolt lengthens and more and more threads become engaged until all the threads are offering a fair share of resistance. It is of course no easy matter to produce absolutely correct pitches, but seeing that irregularities do occur, and that relatively fine threads in the nuts are dangerous, it would be an advantage to aim at not allowing the bolt thread pitch to exceed a certain limit, and also not allowing the nut thread pitch to fall below this limit.

Some insight into the nature of the stresses which occur in bolts and nuts is afforded by the following short modified extract from the paper previously referred to.

The depths of the nuts are assumed to be equal to the cores of the bolt. The numbers in the table, express the resulting stresses at the roots of the threads in the bolts in pounds per square inch for every 10,000 lbs. stress in the unreduced shank of the bolt.

No. of Threads per Core	Bolt and Nut Thread Pitches are equal		Nut Threads are 1-1000 coarser than Bolt Thread Pitches	
Diameter.	Bottom of Nut	Top of Nut	Bottom of Nut	Top of Nut
8	30,800	5,700	17,400	21,600
16	29,700	3,500	13,400	22,500
32	33,400	1,900	11,500	27,500

When the pitch of the nut thread is finer than that of the bolt, the maximum stresses at the roots of the threads are approximately given by the formula—

$$s = 4\sqrt{[T.Z.D. \div 2h \times (T \div 3E + 1/p)]}$$

where T is the tension in the core of the bolt of the diameter D. The depth of thread is h, E is the modulus of elasticity, say about 13,000 tons per square inch, and Z is the shearing modulus of elasticity of the threads, say 1,000 tons per square inch. The ratio of excess pitch of bolt thread over nut thread pitch is 1/p. The above formula does not apply unless 1/p is larger than 1-1000. For a tension stress T of 6.5 tons per square inch the value of T/3E is about 1/6000. We may therefore write—

$$s = 4\sqrt{[T.D. \div 2h \times (1/6 + 1000/p)]}$$

Let $2=65$ tons, $h/D=1\text{-}16$ and $p=1/1000$, then $s=21.2$ tons per square inch, to which shearing stress a portion of the 6.5 ton tension stress has to be added.

If 1/p, the discrepancy between the pitches, should be 4/1000, which was actually the case with a boiler stay-bolt which failed, the shearing stress would be nearly 60 tons per square inch. No wonder, therefore, that this 2½ in. bolt should have failed while its nut was being screwed up.

Doubtless many similar cases occur in practice, but comparatively little notice is taken of them, they being attributed to bad material or carelessness on the part of the workmen. The faulty shape of the threads and pitches seems never to be suspected. However, as this subject deserves the very closest study, it is hoped that cases of broken bolts either of boilers or engines will be mentioned to me for the purpose of fuller investigation.

One reason why it is desirable to look very closely into this matter is the growing practice, started by American automatic tool makers, to supply mild steel which will mill easily. This steel con-

U	0.85	1.13	0.083	
D	0.71	0.89	0.193	Very high sulphur.
Y	1.06	0.05	0.031	High tenacity silicon steel.

tains a large percentage of sulphur. Unfortunately phosphorus is frequently also present in large percentages, and then the bars are very brittle. Quite recently all the screwed stays of a new locomotive boiler had to be removed on account of their brittleness, and other loco boilers having screwed stays from the same steel-maker are constantly breaking their stays.

The above-mentioned new stays contained 0.06 per cent. sulphur, 0.09 per cent. phosphorus, which is already rather high, and .020 per cent. nitrogen, which is very high and suggests that the steel maker had been using a large percentage of Bessemer scrap.

Some time ago, Mr. Dempster-Smith of the Manchester Municipal College, kindly carried out some drilling and trepanning experiments on samples of steel plates of which the chemical analyses and other tests will be found in my pervious notices. As there was a marked blunting of the tools after drilling or trepanning a few holes, a standard sample of steel was drilled for comparison both before and after drilling two test piece holes.

In table 11. the first column contains the distinguishing letter of the sample. The second one contains the relative number of revolutions of the drill per inch of depth of hole drilled, the load on the drill being constant. The third column contains the relative turning force for enlarging the drilled holes to a given size by trepanning, the rate of feed being constant. The fourth column contains the percentage of sulphur, and the fifth one contains remarks about the other impurities.

It will be noticed that sample L with only 0.022 per cent. sulphur offered a maximum resistance of 1.34. Sample D with 0.193 per cent. offered a minimum resistance of 0.71 and 0.89, say 0.8 mean. In other words, the increased percentage of 0.171 per cent. sulphur reduced the cutting resistance by 40 per cent. In view of this very great machining advantage offered by sulphur steels, efforts should be made to make them more reliable than they are at present. They seem to have been tried for motor chains, because blanks made from them punched very easily, but the experiment is said to have proved a failure.

A METAL WITHOUT A PRESS-AGENT

Zinc Needs Publicity

George S. Harney, of the American Zinc Products Company, Greencastle, Ind., advises in an address before the American Zinc Institute, that whenever zinc is used or mentioned in future, it should be called by its proper name. The public must be informed of its desirable qualities and its varied industrial applications. What becomes of all the zinc? For what is it used? The average citizen remembers the sheet zinc that used to go under stoves, and he hazily knows that he has seen zinc-lined refrigerators. But zinc is at work in thousands of other places under what Mr. Harney calls "many noms de plume and noms de guerre," and he is determined that these disguises shall be stripped from it. He says:

"We ought to so change our phraseology and nomenclature that the word 'zinc' should be omnipresent in our discussions. 'Jack' and 'spelter' are good names, perhaps, but they do not convey to the world that they are zinc. 'Galvanizing,' besides being a misnomer, is certainly not the correct term for coating a substance with zinc. 'Zincking' a substance—zinc-coated sheets, nails, wire, and similar material—would be an expression that would convey to the ear of the public the fact that zinc was used to preserve that metal or substance, and from this the public would learn that zinc was the principal factor in the operation. Similar reasoning should apply to 'sherardizing' and other processes in which zinc and the preserving qualities of zinc are necessary to give the other metals life and standing in the commercial world. I suggest these changes for the reason that not one person in ten of this great public that we want to win to the uses and benefits of zinc knows that the words 'jack,' 'spelter,' 'galvanizing,' and 'sherardizing' have any relation to zinc and its preserving properties. And if the public did know these things our battle would be half won.

"Secondly, zinc needs a press-agent. I do not refer to the grandiloquent and verbose personage who writes the fanciful stories of the prima donna's diamonds, nor the lurid picture of the circus, its daring performers and rare animals, but the artist that would write the interesting stories of the usefulness of this strange metal and of the benefits it confers on mankind. Such articles I am sure would go 'big' in our trade papers and publications, and, in view of the fact that the newspapers are searching everywhere for readable and instructive paragraphs that will interest humanity, they would no doubt willingly print them. . . . .

"If short and readable stories concerning the diverse and industrially valuable applications of zinc are furnished them, they will give such articles their initial push on their voyage over the world and on their mission of instruction. But these stories must use the word 'zinc.' The daily paper wants general items of interest, and not trade-names. It wants short stories of human interest.

"Stories about zinc may be semi-scientific in their nature. The world is ready to hear again the story of the Swiss clock that is run by the expansion of zinc. It will willingly read of the non-conducting properties of zinc as it relates to heat and cold. Why, even the story of how in years past zinc has been abused in having to work under so many noms de plume and noms de guerre is a good one and will not only be read, but it will correct an old-time error and aid the work we seek to do.

"I recall the concentrated publicity that has been engendered by manufacturers and producers of other products, and they were not so favorably situated. Take cement. One cent per barrel from the manufacturer, contributed to a central bureau, gave his product the publicity he sought. The railroad was told how to construct a water-tank, and the farmer was instructed in making a pig-trough of cement. Within the year, school children could talk in cement terms and knew of its use. Team-work won for cement. Team-work will win for zinc! . . . .

"In the coming years zinc is to have a more extensive use. Those who fabricate the pig zinc or rolled sheets in a finished product must tell the world of its utility and usefulness, if they are to succeed. Be it a sheet for a roofing, or a slab for casting, the word 'zinc' should follow on to the consumer.

"Hereafter the world will get its vegetable products, such as teas, tobaccos, and like commodities, in zinc containers. It must be told that it is a zinc container, and that zinc is the very metal that will properly preserve the

WELDING AND CUTTING

Repairing a Large Centrifugal Pump

It Often Pays to Repair, Rather Than Replace Machinery, as the Time Saved is a Great Consideration. Here is a Case Where Both Time and Money Were Saved

By J. H. RODGERS

THE type of centrifugal pump used by dredging contractors and mining operators for such purposes as dredging silt, sand, mud and gravel from the bottoms of channels and for mining soft ore by hydraulic mining system, is subject to excessive wear, due to constant abrasion of the sand and gravel against the inner walls of the pump chamber. When the wear becomes so great as to interfere with the operation of the pump, or "sand sucker," as it is commonly called, it becomes necessary, not only to put the pump itself out of commission for repair, but also to hold an expensive dredging barge and its crew in idleness.

Such a sand sucker chamber that had become badly scored through use was recently restored to practically its original condition by the Chicago job welding department of the Oxweld Acetylene Co., by means of the oxy-acetylene process. When it is considered that new castings would have cost about $3,500, and that the actual cost of repairing by welding methods amounted to only one-third as much, it is not surprising that the contractor decided to repair instead of to replace, especially in view of the still more important fact that repairing enabled him to get the dredge back into service with only a few days' delay, whereas replacement meant a delay of from 10 to 12 weeks.

Delay Meant Great Loss

In order to gain some idea of the cost of delay of a hydraulic dredging outfit, an estimate of the earnings of a dredge will be given. In the year 1912 the United States Government estimated the cost of hydraulic dredging to be 7.18 cents per cubic yard. This figure represented the average total unit cost of operating a fleet of hydraulic dredging vessels. The record for one month for one dredging pump having a 20-inch outlet pipe was 456,000 cubic yards of material. At the average unit cost given above, the monthly cost of dredging this amount of material represents over $30,000. The sand sucker shown in the illustration is much larger than the one referred to above. Furthermore, the cost of materials and labor is much greater to-day than in 1912. When such factors as loss of profits, overhead expenses, non-productive labor and contract penalties are taken into consideration, obviously every week of idleness meant a loss of thousands of dollars.

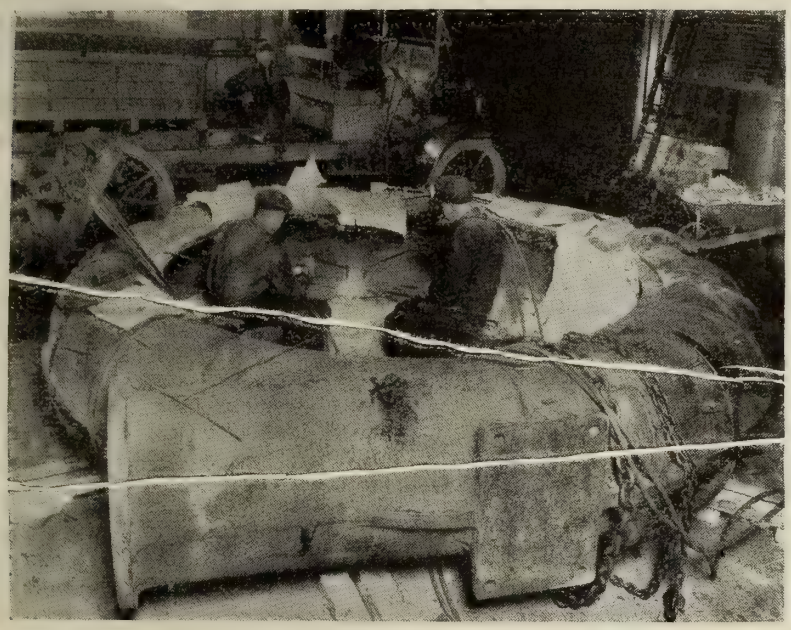
Over Half Ton of Metal Deposited

The pump chamber of the sand sucker illustrated is 14 feet in outside diameter, and consists of two massive steel castings having a total weight of 7 tons. The abrasion had been so severe it was necessary to rebuild both side walls of the pump chamber for a distance of 8 inches from the inner circumference. The thickness of the added metal varied

THIS COMPLETED WORK MEANT A SAVING OF SEVERAL WEEKS TIME, AND NEARLY $2,500 IN CASH TO THE CONTRACTOR.

from 1½ to 2½ inches. In addition, a new section, approximately 14 by 18 inches in area, had to be welded into the throat of the casting. The latter was approximately 3½ inches in thickness.

In order to insure holding the two halves of the chamber in alignment during preheating and welding they were



THIS CASTING IS 14 FT. OUTSIDE DIAMETER, WEIGHING 7 TONS.

bolted together, and the heavy, outer reinforced sections of the castings were not heated as this would have produced internal strains, either breaking the castings or shearing the bolts that held them together. Preheating by means of charcoal was applied locally for a distance of about 14 inches in from the edges of the flanges, each preheat extending for a distance of 3 feet around the inner circumference.

The total weight of steel added to the castings by welding amounted to 1,264 pounds. The operators, each using an Oxweld blowpipe fitted with No. 15 welding head, worked in pairs. As the heat in the small enclosure where the men worked was intense, it was necessary to hold several welders in reserve and to work on the relay plan, each welding shift extending for a period of 20 minutes. Six days were required to complete the building-up work.

Construction Improved by Use of High Carbon Steel

As the built-up surface will be subjected to the same abrasive action of sand and gravel, high carbon steel welding rods were used for the purpose of building up, thereby giving an extremely hard surface, in fact, one that it was impossible to cut with a file, after cooling.

The oxy-acetylene welding work was completed in six days, saving the contractor the expense of several weeks of idleness, nearly $2,500 in cash on the cost of the casting alone, and giving him a pump actually improved in construction, because lined with abrasion-resisting steel.

CUTTING TO A STRAIGHT LINE

There are several methods of following straight lines with the cutting torch, and the one to be used will depend on the conditions, equipment provided and the training of the operator. A line may be followed without a method, by painful concentration on the chalked and prick-punched layout, but this is a hard way. The cutting is likely to be irregular and the operation will tire the cutter. Hand cutting should be done in a manner that requires the least effort and at as nearly uniform speed as possible. Otherwise, the gas consumption will be excessive and the cutting will be ragged.

The method often recommended for long cuts is using a light angle iron laid on the part parallel to the cut, and at such a distance from it that it will permit the torch to be supported on the upturned flange with the head held against the edge, so that the angle forms both a support and a guide. But the cutter cannot always use an angle iron, and it is therefore highly desirable that he learn to cut by another method which will be general in application. The method cannot be very clearly described without illustrations, but sufficient may be said here to give the general idea.

The operator, having laid out the line of the cut, takes a position with reference to the beginning of the cut so that he will be able to move the torch nearly one foot before having to change position. The left elbow is rested on the piece to be cut, with the palm up and the fingers and thumb lightly grasping the torch tubes. The right hand holds the handle, and, as the cut progresses, the left hand is rolled over on the edge of the palm as far as possible before stopping. A straight cut, nearly one foot long, can be made in this manner without changing position.

Another method, somewhat similar, is swinging the left arm on the point of the elbow and letting the torch slip back and forth between the thumb and fingers of the left hand. This latter method is not so elegant, however, as the one just described, for the reason that the operator then must guide the torch with the eye, making it necessary to concentrate on the line. In the before-mentioned method the tip will automatically follow a straight line, provided the correct position is taken and maintained throughout the cut.—"Autogenous Welding."

RESCUE WORK

Oxy-acetylene in rescue work was recently again employed by firemen of the New York City Fire Department, when a young boy was caught in the machinery which operates one of the amusement places, known as the "Witching Waves" at Rockaway Beach, New York.

The boy in some unexplained manner crawled under the waves and was caught in what is known as the left arm rocker. This carried his body up against the bottom of the steel waves and clogged the machinery, which stopped and held him.

It was some time before his cries could be heard, and then the firemen were called. Captain Henry Misfeldt tried to pry him loose and tried to chop the machinery to pieces. It resisted all efforts until an acetylene cutting torch was secured.

The machinery was then cut apart and the boy released. He is seriously injured, in the opinion of the hospital authorities, and would probably have died where he was caught had it not been for the use of the torch.

BREAKING IT GENTLY

The proprietor of a certain traveling menagerie had struck a streak of bad luck, having lost a number of valuable animals by accident and otherwise.

Therefore, it was with sympathetic mien that one of the keepers undertook the task of breaking the news of another disaster. He began thus:

"Mr. Smith, you remember that laughin' hyena in cage 9?"

"Remember the laughing hyena?" demanded the owner angrily. "What the deuce are you driving at?"

"Only this, Mr. Smith, he ain't got nothin' to laugh at this morning."

WITHOUT A PRESS AGENT

Continued from Page 321

contents. Nay, more: the man who offers the spurious substitute must be publicly denounced, and, if possible, prosecuted for his counterfeiting. We must no longer keep our light under the bushel. It is zinc that preserves steel and iron, and wood and fabrics. We must proclaim this fact wherever possible. Every advertisement must boldly proclaim that the product is zinc, and science will verify that zinc is the best metal for such use."

DEVELOPMENTS IN SHOP EQUIPMENT

¼ IN. SOLID DIE, SINGLE STROKE HEADER

The Kent Machine Company of Kent, Ohio, has recently placed on the market a new and improved solid die, single stroke header of ¼ in. capacity, which has many decided advantages when viewed from the standpoint of construction, maintenance and operation.

The principal features of excellence in this machine as provided in the design are as follows:

A Scotch yoke mechanism with solid wedge adjustment replacing the usual connecting rod, with right and left-hand thread adjustment.

A cut-off of generous proportions and great strength with ample wearing surfaces.

A friction feed of unusual accuracy and flexibility.

For assembling and dis-assembling, to repair or otherwise get at the inner working parts of this header, especially convenient arrangements have been provided.

A very small floor space for the capacity of the machine is a feature.

The illustration shows this machine to be strong and heavy in its design, with metal well located to withstand the heavy stresses to which a header is subjected. The bed frame is large in cross section where the tension forces act, and is well reinforced to resist any torsional or distorting forces arising from heading the special non-symmetrical heads at present so much used by automobile manufacturers. The bearings for the crank shaft are large, made of a special alloy bronze and located close to the crank pin, thereby giving no opportunity for any springing or bending action.

The use of the Scotch yoke mechanism for driving the cross-head forward eliminates that vibratory action in the machine which is found in those using the oscillating connecting rod, and at the same time gives such a direct action on the cross-head that it does away with any flexibility due to the angularity of connection. The fly wheel has a tapered square hole in it which fits the end of the shaft, having the form of a frustrum of a pyramid. This is a decided advantage when it is necessary to dis-assemble the machine and, at the same time, gives a positive drive to the full capacity of the belt.

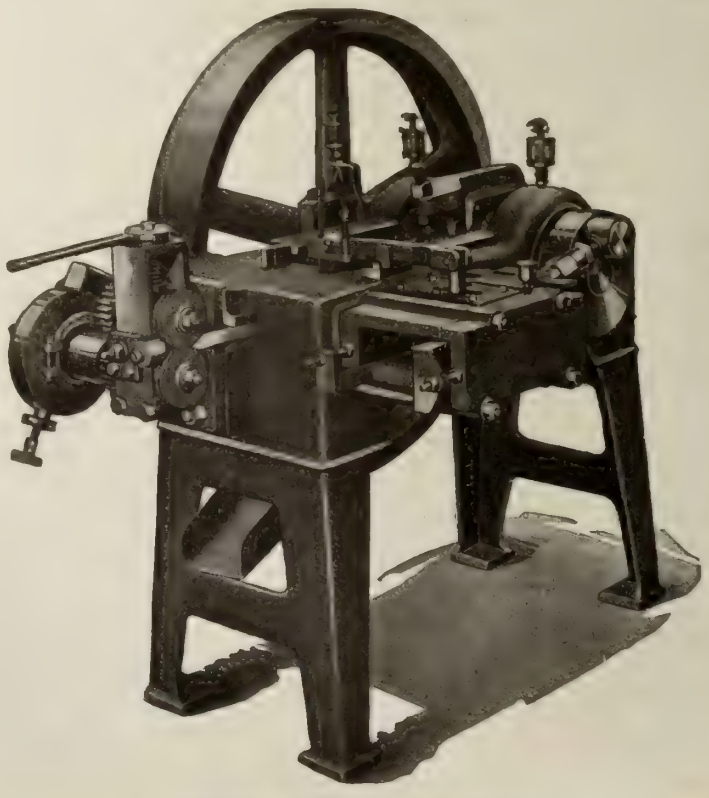
Particular attention has been given to the design of the cut-off mechanism and all parts are of good size, with extra large wearing surfaces and liberal adjustments for wear. The same thought and attention has been given to the accessibility feature in the design of this portion of the machine, and, in case of repair, the removal of four nuts opens up practically the entire cut-off actuating mechanism.

A friction feed is provided, consisting of two grooved feed rolls actuated by a combination ratchet and ball friction device, which in operation gives exceptionally accurate results. A feed stop finger is provided to look after any overfeed setting of the feeding arrangement, although the accuracy of the fe- lieves this finger from any great amount of work or pressure. The length of the feed is regulated and controlled by the hand and check knobs shown projecting from the lower part of the faced disc. The feed may be instantly thrown off by an eighth turn of the lever located on top of the feed roll support.

To dis-assemble the header to get at any portion of the inner working parts is a very simple process. For instance, by removing the gibs used to hold the cross-head in place, the entire cross-head and connection with the crank may be lifted out without disturbing other parts. This is a very important feature when we consider the amount of labor necessary to take down the connecting rod header. The cut-off and feed arrangements may be removed from the bed as units; in fact, one of the strong points of the design is the fact that it has been laid out on the unit design principle.

The adoption of the Scotch yoke mechanism has reduced the size of this machine to such an extent that the saving in floor area of a battery of these machines is a material one.

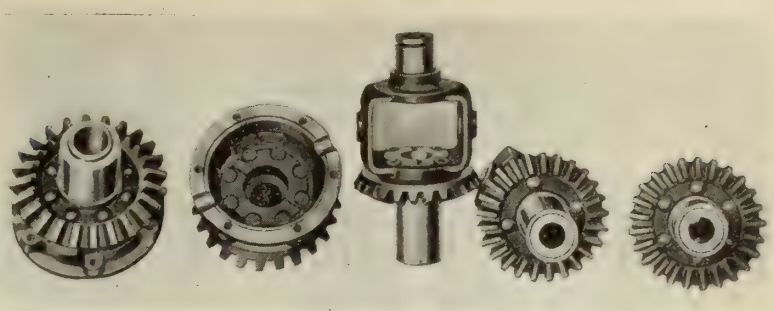
The Kent Machine Co. have had this machine in operation in one of the largest rivet plants in this country for the past two years and its success has demonstrated, without doubt, its efficiency and its serviceability. This is the first of a line of rivet making machinery to be placed on the market by this company.



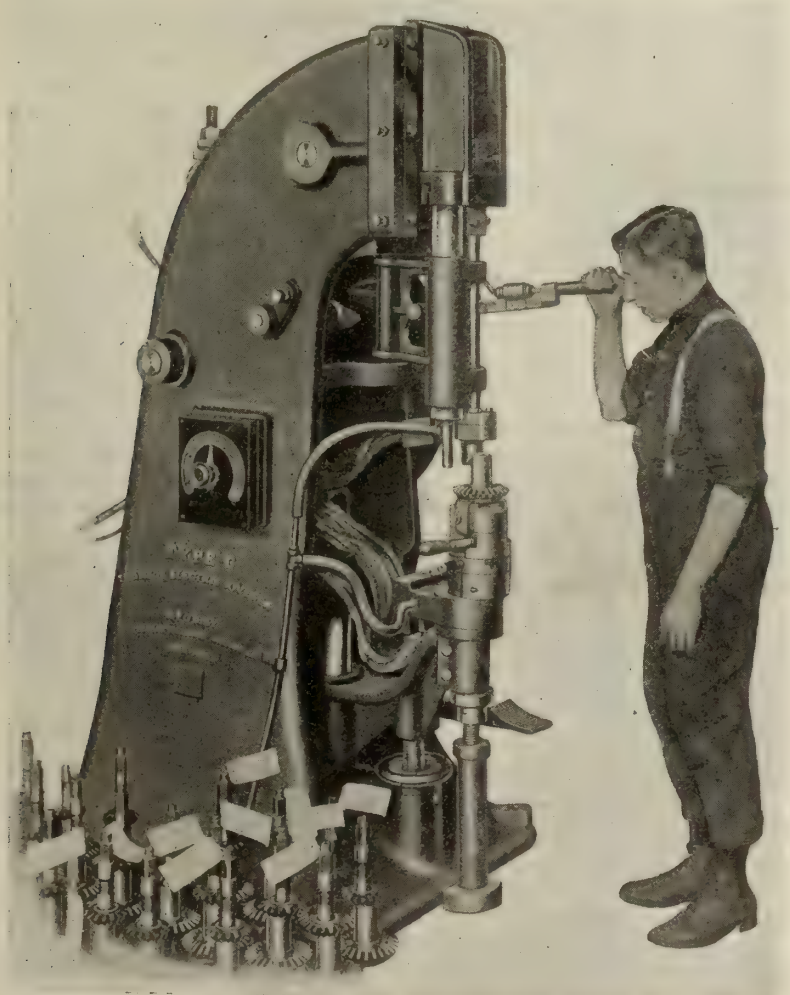
GENERAL VIEW OF THE HEADER.

THOMSON ELECTRIC RIVETING MACHINE

A TYPE C electric riveting machine, which has capacity for handling medium-sized work, has recently been developed and placed on the market by the Thomson Electric Welding Co., Lynn, Mass. This machine will accommodate any commercial lengths of rivets in sizes from ⅜ to ¾ in. in diameter, and it has been so designed that the cycle of operations may be easily controlled with a minimum expenditure of physical effort on the part of the operator. The rivet to be heated is first set in place in the work, which is then laid on the lower die of the riveting machine, so that the head of the rivet rests in a small recessed pocket provided on the face of the lower die in order to preserve its shape. By means of a hand-controlled lever mounted on the sliding head of the machine, the operator now swings the whole head to the left, thus bringing the right-hand copper die directly over the rivet shank. Then by pulling down on the operating handle, the copper heating die is forced into intimate contact with the upper end of the rivet shank that is to be heated. By the application of pressure on a push-button on the outer end of the controlling lever, the electric current is turned on and heating of the rivet is started. When the rivet shank has reached a temperature corresponding to a white heat, the operator releases the pressure of the hand-lever, which allows the copper heating die to be lifted out of the way by a spring, after which he swings the whole sliding head to the right, thus bringing the steel heading die into line over the hot rivet. He then depresses the foot control at the right-hand side of the machine, which engages the clutch on the belt-driven fly-wheel with the press mechanism and causes the heading die to make one full down stroke, after which it returns to the starting position. The clutch is automatically disengaged upon the completion of the return stroke of the press, regardless of whether the foot control is held down or released.



VARIOUS TYPES OF WORK DONE ON THIS TYPE C MACHINE



GENERAL VIEW OF THE MACHINE.

TAPPING MACHINES

The Bicknell-Thomas Co., Greenfield, Mass., have recently brought out a bench type tapping machine

Some of its distinctive features are: compactness, can be operated by girl as there are no protruding parts to catch the fingers or clothing; has cone friction driving mechanism which enables the operator to tap to the bottom of a hole without danger of breaking the tap and it also enables the operator to tap a larger number of holes per day. Twenty four 3-16 holes have been tapped per minute. It has two-speed noiseless gear transmission, which is constantly reversing in grease, oiling all parts of the machine with the exception of the motor.

All spindles are hardened and ground and the main spindle has ball bearings.

The table slide, which is made to hold suitable work holding fixtures, has ball bearings, making it very sensitive to operate, has adjustable stop for the table and is furnished either with or without oil pump and piping.

Strike or Revolution?

THE strike in the steel mills of the United States will take a few days to become clearly defined. Strikes do not stand still. It is easier for them to grow than dwindle and the reason is easy to see. The man who wants to work is marked, and at once becomes the object of pickets, going and coming, and his hours at home are turned into hours of torture for himself and family. It is easy for him to quit work, and very hard for those who want him to work to get in touch with him. Hence it would be natural to look for a growth rather than a shrinkage in the number of those on strike.

There is something about this latest strike that needs explaining, and that is the connection of the American Federation of Labor with it, in view of the fact that the leading spirit of the strike, William Z. Foster, is an I.W.W. agitator, a Syndicalist and an advocate of bloodshed and brute force.

There is plenty of proof of this. Earl C. Ford and Wm. Z. Foster are given as the authors of a book called "Syndicalism." In the last paragraph of the book these words are found: "All workmen interested in this movement, to place the American labor movement upon a Syndicalist basis, can secure full information by communicating with . . . . ." and here follows Foster's address.

This matter has been put squarely before Foster. George Smart, one of the editors of *Iron Age*, went to Pittsburgh and after finding Foster's office, put the accusation straight to him. In Mr. Smart's own words:—

"I said to Foster that I understood he was the man who, at the meeting of the American Federation of Labor in St. Paul, in 1918, introduced a resolution providing for organization of the steel workers and that since he had been in charge of the organizing campaign; that at one time he was an active organizer of the I.W.W. and in 1911 was sent to Europe by that organization and spent much time in France, Germany and Austria-Hungary, mingling with radical laborites; that he was one of the authors of a book on "Syndicalism"; that he appeared at Budapest, Hungary, in August, 1911, and attacked the credentials of James Duncan, first vice-president of the American Federation of Labor, as a delegate of the trade unions of the United States, making a vigorous effort to obtain a seat in the convention on the representation that the I. W. W. was THE labor organization of the United States; that during his stay in Europe he was a regular contributor of "Solidarity," the organ of the I. W. W., and after returning to the United States became a candidate for editor of "Solidarity"; that failing in his ambition, he announced that he would no longer remain in the I. W. W., but would join the A. F. of L. and "bore from within"—that is, get into the stronger organization and inoculate it with his theories."

From evidence produced those charges stand as made. The book published by Ford and Foster is the rankest piece of revolutionary propaganda let loose yet. Here are extracts:—

"Another kind of sabotage widely practised by Syndicalists is the tactics of either ruining or turning out inferior products. Thus, by causing their employers financial losses, they force them to grant their demands. The numerous varieties of this kind of sabotage are known by various terms, such as 'passive resistance,' 'obstructionism,' 'pearled strike,' 'strike of the crossed arms,' etc."

Again, speaking of the industrial revolution:—

"**Bloodshed.**—Another favorite objection of ultra legal and peaceful Socialists is that the general strike would cause bloodshed.

"This is probably true, as every great strike is accompanied by violence. Every forward pace humanity has taken has been gained at the cost of untold suffering and loss of life, and the accomplishment of the revolution will probably be no exception. But the prospect of bloodshed does not frighten the Syndicalist worker, as it does the parlor Socialist. He is too much accustomed to risking himself in the murderous industries and on the hellish battlefields in the niggardly service of his masters, to set much value on his life. He will gladly risk it once, if necessary, in his own behalf. He has no sentimental regards for what may happen to his enemies during the general strike. He leaves them to worry over that detail."

One of the most revolting things in the book of which Foster is joint author reads as follows:—

"**Neo-Malthusianism.**—The Syndicalist is a 'race suicider.' He knows that children are a detriment to him in his daily struggles, and that by rearing them he is at once tying a millstone about his neck and furnishing a new supply of slaves to capitalism. He, therefore, refuses to commit this double error and carries on an extensive campaign to limit births among workers. He has been a powerful factor in reducing births in France, which, according to recent statistics, are annually 35,000 less than the deaths. He is turned from his course neither by the inspired warnings of physicians nor the paid appeal of patriots. He has no race pride and but little fear. He sees in 'race suicide' an effective method of fighting his masters; therefore, he uses it."

Now, the thing is this: Where is the line going to be drawn, if a man holding such views can have the power to call tens of thousands of men to quit work at a given moment on a given day?

Of all the strikes, good, bad and indifferent, that have been staged in recent months, the present one requires the most explaining. The great majority of the strikers are foreign born, from lands where their lot was unspeakably worse than in United States. The reason for this strike is not floating on the surface.

The widespread development of electric power is fast bringing the electric furnace to the front in foundry operations. Not only is it being used in the production of high grade steel castings, but there are indications that its installation in grey iron and malleable foundries will be one of the marked developments of the near future. Thus will be eliminated, certain coal and coke uncertainties and the country's electric wealth be still more widely applied to industrial requirements.

The Coal Business

THERE appears to be too much man-made machinery between the chap who wants to buy a load of coal and the company that owns it when it comes from the mine.

There are coal dealers in the city of Toronto who cannot buy coal from the mines. Were they to approach the company that takes the coal from the mines and ask to be allowed to purchase one or a hundred cars, the answer would be, "Get out of here!" Perhaps not in those words, but the meaning would be the same, and the net result of his purchasing expedition would be likewise.

These dealers are of the opinion that there is so much juggling between the mines and the coal bins of the nation that the last buyer is paying more than necessary.

It is strange beyond explanation that just at a certain time each year there should be a shortage of coal. The well-to-do will tell you to buy in the spring.

Very well, but there are thousands of homes where they cannot afford to buy in the spring. There are thousands of homes where they have to buy coal a ton at a time. There are thousands of little buyers who have no association or organization to protect their interests. Not much. They can shiver or sweat as their luck comes or goes.

The coal business, from pit to furnace, has been raked over and pawed over times without number, and each raking and pawing has seen the ultimate buyer going down a little deeper into his pocket, and has seen the little buyer standing in line a little longer.

The Port Colborne Disaster

THE coroner's enquiry into the fatal explosion at Port Colborne has ended in the way that most of these enquiries do, by a verdict which exonerates everybody concerned, and suggests tacitly that the thing just had to happen. With this view we are not inclined to agree. During the enquiry, evidence was adduced which showed that blowers which are fitted for the express purpose of removing dust, were not allowed to be used, and that in one instance an elevator nearly lost its license through using the blowers after receiving notice to desist.

The Port Colborne elevator is under the control of the Department of Railways and is unique in that respect. However, the Board of Railways does not seem to have interfered in the use of the blowers. This action seems to be the province of the Board of Grain Commissioners, which will not allow the dust to be removed before the grain is weighed. The whole trouble seems to lie in the question of who is going to bear the loss in weight if the dust is removed before the grain is placed in the elevator, and the question is shirked in a manner that deliberately endangers human lives. The fact that the risk is always present where there is dust is amply proved by the number of minor explosions which take place, and as further proof, we have the explosion of a nest of elevators in Kansas City just a few weeks after the Port Colborne disaster. Here again the results were fatal.

Boards have been appointed to enquire into this situation, and they have sat and presumably deliberated and made reports. The evil still persists. Truly it would seem that the cheapest thing in this country is human life. While the country is filled with exhortations to count "Safety First," men are being killed by a preventable cause, which is not prevented through the greed of the principal users of the elevators. The presence of a dust-laden atmosphere, whether it is coal dust, grain dust, sawdust, or textile material dust as in the New York triangle fire, is a source of danger of the highest potential. Its admixture with the surrounding air is so complete, that the introduction of the tiniest spark starts combustion, which takes place so rapidly and perfectly that it is explosive in its intensity.

There may be some loss occasioned by blowing the dust, or there may be some reason apart from that of financial loss against the use of the blower. The public and the men who work in these elevators should be satisfied beyond any reasonable doubt that all necessary precautions are being taken to make their occupations a safe one.

Our Old Friend John Barley

THEY used to raise a song on high to old John Barleycorn, and voices filled with clinkers jarred the early hours of morn, when chaps who made their homeward jaunt with tangles in their feet, and tried to find a keyhole somewhere along the street.

Oh, in them days what's went and gone and never to come back, men used to meet their gentle wives, salute 'em with a whack, and put their feet upon the couch and muss up all the duds, when they had lingered far too long before the cheering suds.

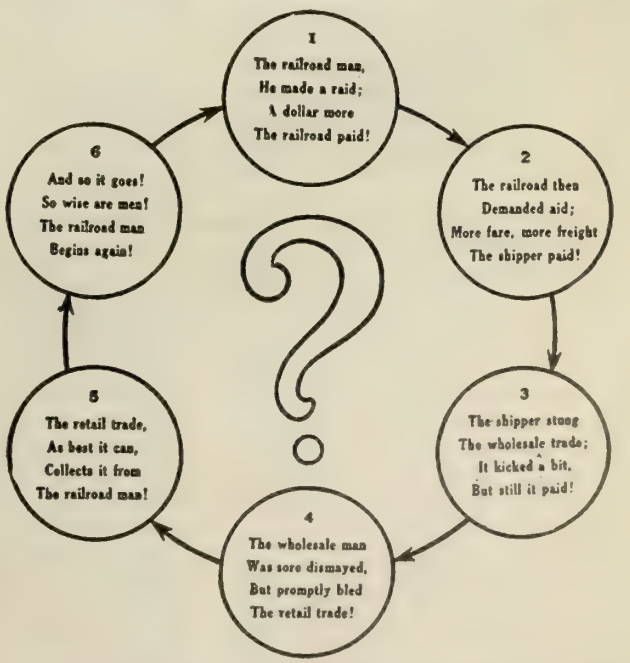
They used to try to make a speech, they used to start a fight, they used to decorate the porch and sleep out there all night—they never had a dollar then to buy two pair of shoes, when they was passin' out their coin to saturate in booze.

Men used to take and plant their feet upon the old brass rail, and call up thirsty ones to quaff large hunks of rye and ale.

But now they've learned to wend their ways unto the water spout, and souse their long and thirsty throats without a drunken bout.

So when they come to us and say old Barley's at the door and wants to come and dwell with us like in the days of yore, we'll double up our horny fist, we'll grab the boot-jack, too, and swat that chap who used to bring the red nose and the stew.

We'll take him by the collar and we'll lead him to the fence, and tell him for to speed up quick and take his carcass hence—and when he tries to tell of days when we swigged rye and beer, we'll shake our horny fist and say: "John Barley, scat from here!"—ARK.



"The vicious circle is infinite; increased wages are over-capitalized for inflated profits, and the cost of goods mounts faster than the wage level."—Statement of the Four Brotherhoods of Railroad Employees. From the New York *Evening Post.*

Hours of Work a Point Not Settled at Ottawa

Labor Delegates Were the Orators, While the Employers Seemed to Have a Greater Array of Facts and Statistics at Their Disposal —Summary of Industrial Conference

By T. M. FRASER, Ottawa Representative of MacLean Papers

OTTAWA.—It was the intention of the Government, in order that there might be no appearance of capital and labor being drawn upon opposite sides with the suggestion that they were in hostile array, that the delegates to the National Industrial Conference should take their seats in chance fashion; but the sheep and the goats automatically sorted themselves, the representatives of capital occupying the seats on the left of the chairman, Hon. Senator Gideon Robertson, while labor faced them on his right. Down the middle of the Senate Chamber were grouped the representatives of the Governments. Such of the common people as could get room hung about the door of the chamber, though there were few of these.

The daily proceedings of the conference have been so fully reported that it is not the intention here to do more than mention a few of the interesting features and side-lights. How much, if anything material the conference may accomplish will not be known immediately. Broadly speaking, the expectations of the different parties to it might be summed up sufficiently well by an examination of three or four of the principal speeches delivered. As. Hon. W. L. Mackenzie King very ably pointed out in the able speech he delivered on the opening day of the convention, the parties to industry and its problems are not the two, capital and labor, most commonly mentioned; they are four: Capital, labor, management, and the community. And of these, the community is the most important and the most interested, in that it embraces the other three as well as the people in general.

While the two main parties to the conference came together with as much diplomatic courtesy as could be expected, and while the proceedings and debate suffered nothing from comparison in this or any other respect with any debate in the House of Commons, it would be only camouflage to say that capital and labor were not very far apart on their conception of what was rightfully due to each. Self-interest rather than pure reason has dominated the councils of both for so long that it is vain to expect that now or, probably, for a long time to come shall we find either being distinguished by a spirit of "sweat reasonableness," or see self-interest give way to self-sacrifice. On the first day of the convention, if we could have read the mind of those who looked across at each other, we might have found distrust, resentment, and the sense of being subjected to tyranny. It was plain that each expected more from the party in the middle (the Government) than from the party opposite.

The Two Attitudes

The attitude of Labor at the convention was one of aggressiveness. Capital typified resistance. Labor said: "How much can we get?" Capital pondered: "How far can we afford to go?" And if the resistance of capital to the demand, for instance, for a 44-hour week was strong, it must be borne in mind that that, in the words of one of the labor representatives, was "not an ideal, but a compromise." And when Mr. Tom Moore, president of the Trades and Labor Congress, and chief labor representative, exclaimed heartily, "Hear, hear," those present were reminded that he himself, in a speech at Toronto not long ago spoke of a 36-hour week as about right. Capital, recognizing the necessity of production, sees the hours of labor heading towards an impossible minimum, with overtime, the handmaiden of the "shorter working day," reaching an impossible maximum. Capital believes, and not without justification, that the ideal of the vast majority of working men is to cut the length of the "straight" working day as short as possible in order that more overtime, with its enhanced rates, may be secured. The plea of certain of the speakers among the labor representatives that, with the present working hours, there is no time left to the workingman for "improvement," is sufficiently refuted by figures which the Minister of Labor introduced for the purpose of showing that the shorter day already obtains in large measure in Canada. Forty-seven per cent. of the working men of Canada already work eight hours or less.

The Farmer's Status

This question of the reduction of the hours of labor—a constant scaling down of the length of the "straight" workday, then, is the big point—at least the big controversial point—of the convention. As stated above, it obtains so commonly that employers must, on the whole, be far from making much fight against it, but the object of labor is to have it made a statutory matter for the whole of Canada. I think the final quietus was put on this in a brief and moderate speech by Hon. Charles A. Dunning, Minister of Agriculture, and in charge of labor matters in the Government of Saskatchewan. He desired to have it made plain in the status of the farmer, who was in a sense both a capitalist and a laborer, and who represented probably the largest industrial element in the population of Canada, under a statutory standardization of the hours of labor. "It seems to me," said Hon. Mr. Dunning, "as a farmer of very long experience, that until it is possible for you to legislate to control the sun and the winds and the clouds and the rain, it is impracticable for you to legislate to effectively control the hours and the distribution of labor in agriculture."

It seems scarcely probable that agricultural labor, even if omitted from the operation and benefits of any possible 8-hour or other day which might be made law, would long rest content under this exclusion, or that organized labor could refuse to support the extension of the principle to them. As was also pointed out by Mr. Dunning, if working conditions are to be made still more attractive in the cities by shorter hours, the difficulty of getting men for farm work would be almost insuperable. The consideration of possibilities of this sort struck the members of the convention very forcibly.

Eloquence vs. Facts

What would strike the impartial observer of the proceedings was that the right side of the assembly seemed to have almost a monopoly of the eloquence. There was scarcely a man among the many who spoke for labor but could present his arguments in well-chosen and grammatical language, and without a trace of diffidence; there were some who were speakers of a very high order, while the speaker with perhaps the most distinct enunciation, the most clear-headed manner of thinking, and the most fluency in the whole assemblage was a tailoress of Vancouver —Miss Gutteridge. She is an Englishwoman—and here it might be noted that the great proportion of the representatives of labor present were not Canadian-born. In fact, very few were. Perhaps the other ninety per cent. of labor in Canada, which was not represented at the convention, belong largely to that class. I mentioned to a representative of the manufacturers this striking fact that the speaking ability was so largely confined to the other side. "Naturally," he replied. "They spend most of their leisure time at it, and practice makes perfect. We have been too busy trying to raise the payroll to have had much time for practising oratory."

I think it would be fair to say, however, that if the position of the labor

MARKET DEVELOPMENTS

Canada Watches the U. S. Steel Strike

May Have an Important Bearing on the Markets Here—Structurals Are Much in Demand—Machine Salesmen Report Orders as Being Very Satisfactory

THE MARKETS AT A GLANCE

THE strike in the steel mills of United States has a very direct interest for the whole Canadian steel, iron and machinery trade. Stocks in the warehouses of this country are fairly well filled, but warehouse business is not the kind that keeps things going, for most of the tonnage goes direct to the mills and is shipped direct to the purchaser, warehouse prices being higher and less popular in consequence. Canadian steel mills are in good shape to take care of many lines, but not so in plates particularly, a hold-up of which would be poor business were it continued for any length of time.

There is a big demand for structurals in Ontario at present, and one of the dealers took occasion to remark that now that the United States mills stand in danger of being shut off, the rush sets in to buy structurals. Big tonnages are in the offices of architects and fabricating concerns, and although it is late in the season it looks as though the much talked-of buying movement in structurals has set in.

Machinery dealers report good business. In fact many of the best houses are getting all they can handle and a little more. They find it difficult to secure the machines as rapidly as needed.

Speaking of the machine tool situation, it is interesting to note that there is not much export business going to United States firms at present. For instance, Sweden is in need of quite a large list of machine tools, and the chances seem to be that Germany will get the business. The reason is this, that Germany can undersell United States in Sweden to the extent of between fifty and sixty per cent. Prices, the rate of exchange and the low value of the German mark all help to stimulate this movement.

Prices remain firm in all lines in the machinery field. Many cases have values up to war times, and there does not seem to be any good evidence in sight that a reduction is even being considered.

U.S. STEEL STRIKE REFLECTED IN MONTREAL MARKET CONDITIONS

Special to CANADIAN MACHINERY.

MONTREAL, Que., Sept. 25.—The near approach of a tie-up in the steel industry has been partly responsible for the quiet tone of the existing market, and the general situation here has been in a reserved state of tension for the past week. To some extent this is still more or less evident, but a more optimistic feeling prevails throughout the trade, and it is thought by many that the strike situation will be confined to those works that are now involved. However, it is premature to even guess to what extent a strike of this nature will affect general business. Business in this district is moving steadily, but it is still of a conservative character. Metals are moving freely on a firm market.

Machinery demand shows a little improvement with used equipment less pronounced. Scrap is quiet but may be affected by the strike of steel workers.

Local Interest in Steel Strike

The attention of the entire steel industry is now centred in the steel strike that is in force in the United States. It is a little too early to pass on the possibilities that may arise as a result of the strike, but the situation and the developments will be closely watched by all those associated in any way with the steel business. Asked as to the effect on Canadian conditions, a dealer here stated: "It will be some days before we can tell the effect of the strike, but unless the cessation of operations spreads throughout the entire steel producing districts, and the independent mills become involved, we will not be affected here to any great extent. We are carrying considerable stock, and this will be ample for existing requirements for some little period. Then again, we will be able to get supplies in from the States as there are many sources of supplies apart from those actually affected by the strike. Ship plates will be harder to get, but many of the yards here are fairly well stocked and would be able to operate for quite a spell before feeling the pressure of the strike. On the whole we do not expect a serious condition here, but, as stated before, it is too early to predict the events of the immediate future. Should the strike spread and other mills become involved, and the situation develop into a general fight between the men and the producers, the effect will naturally be felt here, and as a consequence prices may show a tendency." Trading here is of a general character, not heavy but of steady volume. Prices are unchanged and very firm.

Used Machinery Being Absorbed

While it cannot be said that the business in the machine tool trade is of the active kind, there appears to be visible signs that the demand is improving, even though slight. Some dealers report a very good week with new tools showing up better. It was remarked by one dealer that the available supply of used machinery is apparently diminishing, and it is believed that no small amount of this class of equipment has already been absorbed. In this connection one dealer stated: "During the past season we have disposed of quite a large number of tools that we picked up from many of the shell shops, such as lathes, drills and shapers. The demand on the aggregate has been quite heavy and these tools have been going to all sorts of places. Quite a number have been acquired by men who, prior to the war, lived on farms or in villages throughout

the province. Inquiry showed that many of these men who had attained a fairly good knowldege of machine shop work intended starting a small repair shop, where they hoped to reap returns on their shell experience. The money they had earned, and the reasonable price of the old machines were factors that induced them to start out on their own account, and some of these men are doing well."

Scrap is Unchanged

The tension that has been evident in steel circles over the possibility of a strike in the States has been reflected here to some extent, and as the atmosphere to-day is filled with the first real signs of strife, the trade here is anxiously awaiting further developments. The past week has seen little but normal trading in scrap and the business passing is mostly going to the foundry trade, as the demand for machinery scrap and stove plate is of good volume. There is a steady movement in the non-ferrous scraps but the demand in this respect is about as usual. Dealers are not disposed to state what will take place should the strike attain any degree of magnitude, and for the present will hold to current quotations. Should the strike be of long duration it is altogether likely that the market here will be stronger. However, it is the opinion of the trade here that a settlement will be made before the close of the week. Word received from Cleveland by a local dealer was to the effect that the situation last Friday was more serious than it appears to be to-day. Few here will commit themselves, and several days must elapse before the full possibilities will develop. Price quotations remain unchanged with the market firm.

POINTS IN WEEK'S MARKETING NOTES

The steel strike is going to have an effect on the Canadian market, though just how soon or how marked it is hard to say. Some warehouse stocks are fairly well filled up, but most of the business is direct from mills to users, on account of price.

—

The movement in structurals is particularly marked at present. Some contracts as high as a thousand tons are being figured on.

—

Machine tool dealers report business as being excellent, sales being of new tools with a decrease in the request for used machinery.

—

Capacity for handling tool room work on a large scale is not easy to find in this district.

—

Firms selling steel from U. S. mills were taking on business as usual this week, subject to the usual strike and other contingency provisions.

STILL ACCEPTING ORDERS FOR STEEL

No Difference Noticed Yet—Business in Structurals is Better Than Ever

TORONTO.—The trade in general watches the steel mill strike in the United States with keen interest. While some lines may not be hit for some time to come, there is a feeling that cannot be disguised that the ramifications of the struggle are extremely wide, and that no particular section of industry can claim immunity.

As far as CANADIAN MACHINERY could learn as this issue went to press, the firms selling for the American steel mills were not making any difference in their selling policy. They were accepting business, and reported particular activity in structural material. In fact one of the dealers emphasized the fact that the amount of structurals offering now was an outstanding feature of the business. "Those who want to buy now and who may be inconvenienced in the matter of delivery are paying the price for staying out of the market too long. For months past there has been plenty of capacity in the mills rolling structurals to give splendid deliveries, but prospective builders continued to stay out, thinking that the prices were going to come down. It was useless to point out reasons why prices would not come down, although the steel trade has known for a long time that prices were going to stay up as costs would not permit anything else."

It must be remembered, of course, that business placed with the mills at any time is subject to strikes and other delays over which the authorities can have no control.

Selling is Brisk

Machine tool business is good in this district. And when that is said, there are no reservations or unstated conditions. There are, in some cases, good machines tools of standard makes standing on the floors of the Toronto warehouses. If one will look carefully enough he will see that the word "Sold" has been written on them. There are places where that same word could have been written three or four times, and as a matter of fact, in several cases they have been sold twice.

The automobile business is buying a lot of machinery in Ontario. This industry has been by long odds the best purchaser on the market for a good many months.

There is danger that the effects of the strikes in this country are going to be felt still in some places. Moulders are out of some shops yet, and in others work has been turned to other channels. There is, it is safe to say, a scarcity of tool room capacity in this province at the present time. Not that there may not be tool rooms that could take on more work, but we refer here to the capacity to handle the special tool, jig and fixture work of a fairly large concern. Machine salesmen are anxious, naturally, to hold as much of this sort of work on this side of the line as possible, but are finding it difficult in some cases to do so.

There is a tendency on the part of some concerns to hold back to see if there is going to be any limit to the things that are being asked for by some of the strikers. For instance, many of the Detroit metal workers are going to ask for $1 per hour, and the same feeling may grow in the Canadian territory across the river from that centre. These jumps now, coming on the top of a long list of things that drive costs up, are not going to help the placing of business.

Machine tool builders find that labor efficiency is not improving in many instances. They claim that increases in wages have been much larger than increases in efficiency or production. Of course, it is impossible each time that an increase in wages is given to have it accompanied by an increase in production, as such a thing may be physically impossible. Yet the fact remains that the increases in wages have far outstripped the increases in production. That has brought costs to a high plane, and they are there to stay for some time.

For the most part the machinery that is being sold now is new stuff, direct from the shops. By this, it is not meant that the used machine has departed from the market, but the war shop bogey has become a thing not to be afraid of any more.

How About the Strike?

The strike in the steel industry in United States will be felt in this country if the production is curtailed. It should make a good demand for material that can be produced by the Canadian mills. Of course, it is hard to tell for a few days just how effective the strike may be. Steel making is such a continuous process that there are several ways in which the whole works can be tied up. But the selling offices of the United States Steel Corporation have nothing to say about the situation, and it would be thought, were conditions serious, that they would be less sure of future deliveries. Only in one or two orders so far this week have they held back. Most of the business that passes from Canada to U. S. mills is straight mill, not warehouse business, and in this way the effect of the strike, were it serious enough to affect production, would be felt almost at once here. Warehouses carry a general stock, but much of the stuff that Canadians want from the U. S. steel mills is special material, rolled to order, and not taken from warehouses. Not only so, but the warehouse prices are so much higher than mill as to make too great a difference, unless there is real urgency in the job, and a chance to recover the difference between warehouse and mill prices from the customer.

STRIKE IN STEEL MILLS FLATTENS OUT THE MACHINE TOOL PROSPECTS

Special to CANADIAN MACHINERY.

NEW YORK, Sept. 25.—The expectation of a steel strike has had the effect of reducing demand for machine tools to the minimum. With the exception of scattered orders for single tools or lots of two or three, there is very little in the market, so far as domestic trade is concerned. As for export, the European countries are barred from buying here on favorable terms by the exchange situation, and until there is a more even balance of exchange it is impossible to expect that any very important buying for shipment to Europe will develop. One exception to this is noted in the case of a concern in Switzerland which is placing orders here against a list of tools required for the manufacture of electric motors in that country. Purchases will total about $250,000, and a part of this business has already been booked.

American exporters of machine tools hear more of German competition in some of the European countries. For example, Sweden needs large numbers of machine tools, but a good share of the business probably will go to Germany. That country is quoting prices that are 50 or 60 per cent. lower than American prices, irrespective of the exchange.

The principal domestic buyers of tools in the East are the Gillespie Motors Corporation, Paterson, N.J., and the E. W. Bliss Co., Brooklyn.

THE I.W.W. CAST-OFFS ARE SAID TO BE BEHIND THE STEEL STRIKE

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., September 23.—At this writing it is quite impossible to gauge the extent or make any attempt to estimate the duration of the strike in the iron and steel industry. The matter rests not so much upon the proportion of men going on strike at the outset as upon whether the movement gains or loses as the days pass. An important fact is that it is much easier to induce a man not to work than to induce him to work. If he attempts to go to work the strikers can fine him and employ the familiar methods of intimidation. If he stays away from work those who want to work are quite certain not to hunt him up and threaten him if he does not work. Undoubtedly the strike leaders depend much upon mob psychology to carry their point. Nor can the amount of idleness in the iron and steel industry be measured by the proportion of men who strike, first because a few strikers may close a plant because it cannot operate with a certain department idle, and second, because there are such ramifications between plants. A strike tying up the lake vessels that carry iron ore would not affect the blast furnaces, as nearly all the season's ore has been moved, the full movement of one navigation season being sufficient to carry the furnaces into May or June the following year. Of the many cases in the opposite direction one may be cited. The foundries making ingot moulds for the steel works use direct metal from the blast furnace (no cupolas), and if the steel works close they do not need ingot moulds. Accordingly, the ingot mould foundry closes, the blast furnace must bank and the blast furnace suspends shipments of coke whereby coke ovens are made idle. At the other end of the chain there may be a rolling mill which uses purchased steel. Its men may be ready to work, but the stock of steel is small, hence, eventually the finishing mill would have to close if the steel producing mill closed. Thus the closing simply of steel producing plants would close coke works at one end of the chain and finishing mills producing merchant bars, sheets, tin plate, etc., at the other end of the chain

Who are the Strikers?

Just who the strikers are is well defined. William Z. Foster, secretary-treasurer of the general organizing committee, and the leader in the Pittsburgh district; Fitzpatrick, the chairman, being in Chicago, was formerly an I.W.W. man and left the organization years ago upon being defeated in his aspiration to be editor of Solidarity, the I.W.W. official publication, joining the A. F. of L. with the statement that he intended to "bore from within." A pamphlet he wrote years ago, advocating the most lawless methods, is now being circulated to show his real character, which undoubtedly has not changed. Even as to the "24 unions" which the organizing committee was formed to represent, there is not unanimity. The officials made an effort to conceal the fact that the session occupying Wednesday and Thursday of last week was for the purpose of discussing whether the strike order should be recalled in view of the White House conference on labor, scheduled for Oct. 6, asserting that the subject was not being discussed, the meeting being for the purpose of making plans for the strike, but it became known positively that there was much dicussion of that subject, and in the letter the organizers sent to President Wilson the statement is made that they carefully considered for two days the matter of calling off the strike.

Just how many of the 24 unions were in favor of postponement is not known, but on Friday, the day after the conference adjourned, one of the unions, the International Union of Steam and Operating Engineers, sent an order to all its locals, saying that the officials were in favor of awaiting the result of the labor conference of October 6, and saying "all members are instructed to refrain from affiliating themselves in any way with the proposed strike." There may be several unions, anything short of a majority of the 24, to take similar action. As to the American Federation of Labor itself, its position is not clear. The strike is by individual unions banded together, not by the federation itself, and it is generally believed that Samual Gompers, president of the federation, is opposed to the strike.

Is There a Strike Fund?

As to funds, it does not appear that there is any large strike fund. Foster made a curious statement more than a week ago, to the effect that strike benefits would be paid to strikers who had not joined as well as to those who had. Joining, at least in the case of a large part of the common labor taken in, consisted in the joiner paying $3, of which the organizer received $2 as payment for his work. Unions like the boiler makers, machinists, etc., may have much money, and as the great bulk of their membership is outside the steel industry, they can raise funds, but it is quite improbable that any of the funds would be diverted to payment of strike benefits to men not members of their respective crafts.

Considering all the information now available practically all the chances are that the strike will either fail shortly or will develop into an I.W.W. or Bolshevist movement. A regularly conducted strike such as union men usually plan to have seems entirely improbable.

A fortnight or more ago it was a common idea among iron and steel producers that if there was any prospect of trouble at any particular plant, that plant should be closed at once so as to "beat the men to it." This idea was abandoned a week or so ago by almost all the producers, through their concluding that it was improper to take the risk of closing a plant that might otherwise have been able to run, as public sentiment might be adverse. A few plants in the Pittsburgh district were closed before the end of last week. In the case of the two at Brackenridge the officials made a statement that the closing was for the purpose of giving the men opportunity to hold meetings Satuday to decide whether or not they desired to strike.

Stocks Are Normal

Jobbers and manufacturing consumers of steel have approximately their normal stocks, and much larger stocks than they had last April and May, when buyers of steel had no confidence in the future of prices and were conducting business on a strictly hand to mouth basis. Normal stocks, however, are not large stocks, except in the case of a few manufacturing industries like the automobile industry. While jobbers' stocks would last for several weeks in fair

shape, and for longer periods in broken condition, they would last but a very short time should consumers who ordinarily draw supplies from mills turn to jobbers instead. This, however, is quite improbable, as the cost would be too high. Moreover, it was understood several days ago that many jobbers had already planned to advance prices promptly in the event of any scarcity developing, so as to make as much money as possible out of their position. As this might be regarded as "profiteering," many jobbers may refrain from advancing prices in the event of a scarcity.

The Strike Report

A rough guess would be that one-third of the iron and steel industry of the United States is idle on account of the strike. In some cases there are men willing to work, but the department is unable to run on account of other departments being on strike. The Chicago district is largely closed; the Wheeling district is practically altogether closed, or will be within a day or two. The Youngstown district is three-fourths closed, and the Pittsburgh district, including the Monongahela Valley, is operating almost full. Various detached plants are but little affected. Steel officials are strongly of the opinion that if the Monongahela Valley can be kept operating as well as at present, the men now on strike in other districts will return to work. The Carnegie Steel Co. has twenty-seven blast furnaces in the Monongahela Valley, of which twenty-two were operating and eleven are now banked, the other eleven being in full operation. At the steel works at these same points the operations are very good, as Duquesne is operating one hundred per cent., Edgar Thompson is operating practically full, and Homestead nearly full. The strike is confined entirely to the foreign-born labor. Officials of the steel companies state that the strike situation is somewhat better than they expected, and while they regard it as premature to predict that the strike will play out in a week or two, they have strong hopes in that direction.

BUYERS NOT LIKELY TO BOOK VERY HEAVY ON QUOTATIONS GIVEN FOR 1920

Stocks are still being depleted, and iron for 1920 is not very easy to get. In these circumstances advances are to be had for the asking. Foundry iron is the principal demand. Following are reports from U. S. points:

Cleveland.—Although 1920 business is not being sought after, some orders have been placed. One for 5,000 tons was accepted at the $26.75 furnace base.

Foundry iron for this year's delivery is hard to get, and furnaces are making sales at points far distant from their natural selling zone. Steel making sales are quiet. Stocks are being lowered by continued heavy shipments.

Boston:—Selling here has been confined to small tonnages, and with one notable exception, 1920 iron is quoted at an advance of $1 on present prices. The exception is a Buffalo furnace, which is offering 1920 iron at $29 for 2X eastern. Some large orders are expected to materialize in the near future, but 300 ton lots represent the largest sales just now.

New York.—There have been small sales to local foundries which find they require additional tonnage to fill their orders. Business generally is in small lots of foundry grades, which have reached a fair aggregate. One order for 10,000 tons, about equally divided between this year and next, was placed at full price.

Philadelphia.—The market is quiet, with both sides holding off. The rate quoted for No. 2X is $31, delivered, although where rates are favorable $30 has been mentioned. Steel making grades, as well as low phosphorus iron are dead, while charcoal iron producers are booked up and out of the market for this year.

Pittsburgh.—General dullness marks the trading here, and what little demand there is in evidence is for foundry iron. Prices for next year delivery are being quoted at a rate which is plainly meant to discourage the buyer. Steel making grades are dull, and while prices are holding up nominally, purchases are said to have been made at 50 cents below the quoted rate. The demand from automobile makers for deliveries has stimulated this market.

Buffalo:—Sales for 1920 are still small, as the labor situation is still a cause for uneasiness. Some small tonnages have been accepted at small advances. The demand for foundry iron is increasing.

Chicago.—A fairly large tonnage has been sold here for next year delivery. No. 2 foundry is being quoted at $26.75, with $1 added to the usual silicon differentials above $2.25c. There is a good enquiry from a few users for malleable and foundry, but there is no sign of a general demand. Enquiries are for lots of 500 to 5,000 tons.

Cincinnati.—Business in the south is exceedingly light, with furnaces showing no disposition to get after new year business. Jackson Co. furnaces are still idle. Virginia iron is quoted at $30, furnace, with not much iron offering.

St. Louis.—There is a good business being done in small lots of pig iron, and the outlook is good. Most of the business is for immediate shipment, or not later than October, and prices are firm. Freight car shortage is still a factor, deliveries on contracts being much delayed.

Birmingham.—Brisk sales and increased prices are the conditions here. Car shortage is helping to keep deliveries back, and in addition to this, production is falling short of sales. 1.75 to 2.25 silicon iron has sold at $27.50 and $27.75, furnace. A new schedule of silicon differentials quoted by one maker adds 4c to the prices for each half of 1% above 2.25.

SUDDEN DEATH OF W. C. GURNEY

Prominent Toronto Business Man—President and General Manager Gurney Foundry Co., Ltd.

W. Cromwell Gurney, president and general manager of the Gurney Foundry Co., Ltd., collapsed suddenly while visiting the office of his physician for routine treatment. In spite of the efforts

The late W. C. GURNEY.

of two other physicians present, resuscitation was impossible, and Mr. Gurney passed away from heart failure.

Earlier in the year Mr. Gurney suffered from influenza, from which he had not made a complete recovery. The sudden death of his mother only recently affected him profoundly, and since that tragic event he had been upset and unlike himself. The news of his death came with shocking suddenness.

Mr. Gurney, who was in his 46th year, was the son of the late Edward Gurney, whom he succeeded as president of the firm upon the latter's death a few years ago. He was educated at Upper Canada College, and then entered the Gurney Foundry Co. He was a member of the National Club, Lambton Golf Club, the Canadian Manufacturers' Association, the Board of Trade, and was one of the best-known of Toronto's business men.

CORRECTION

In the leading article of last week's CANADIAN MACHINERY on "Tractor Ploughing Machine of Unique Design," there is an error appearing in the closing paragraph. It states that the machine is capable of ploughing an acre an hour. This should read—three acres an hour, or 30 acres in 10 hours.

STEEL STRIKE HAS PUT SHIVERS IN THE U.S. SCRAP METAL TRADE

The market is dull and unsettled all over the country. The uncertainty due to the threats of the steel strike is causing a waiting attitude on the part of buyers. Following are reports from various U. S. points:

Chicago.—There is very little scrap being sold, and prices are softening. Dealers are inclined to hold their stocks as they feel that the market has intrinsic strength, which will develop after the labor situation is more settled. Railroad offerings are small, aggregating about 5,000 tons.

Boston.—The market has been marked by unsteadiness during the week. Prices are off, heavy melting steel having been sold at $15. Several lots of Government scrap were withdrawn owing to the low prices offered. Malleable scrap was bought at $21, delivered.

New York.—The best demand is for cast scrap, but even in this grade the business is small. In spite of this there is a firm tone to prices. The fact of Government offers being withdrawn till better offers are forthcoming has had a good effect in keeping up prices.

Philadelphia.—Machine shop and blast furnace turnings, and the lighter grades have been in good demand, and prices have advanced somewhat. The demand for heavy melting steel has been very small. The Ordnance offer approximately 6,000 tons of forgings at various locations.

Pittsburgh.—The demand for cast iron scrap is good here, and has resulted in advances of from 50 cents to $1 in these grades. Malleable is also a strong grade, demands being ahead of offerings. Heavy melting can be got at $21 delivered at Pittsburgh, and prices show a tendency to weaken further.

Buffalo.—Melters are busy, and the demand for scrap is accordingly stronger, some fair tonnages having been sold. Borings and heavy axle turnings are also in request.

Cleveland.—The labor situation is influencing consumers, who are waiting developments. The scrap market is very dull, and this condition is looked for for some time, transactions even among dealers being few few. A sale of 50,000 tons of heavy melting steel at $21.50 to a large consumer is reported.

Cincinnati.—There is little demand, and the market is weak. While foundry scrap prices are holding their own, steel mill scrap is weak. The car shortage is still being felt.

St. Louis.—There have been some backward movements of scrap prices during the week, but foundry scrap is in good demand. Railroads are offering 4,000 tons, and the Ordnance about 7,000 tons at two different plants.

Birmigham.—There is a better demand for iron and steel scrap, and prices are holding firm. It is probable that there may be an advance shortly, as business for the last quarter is expected to be brisk.

MONTREAL NOTES

Lawrence Russell, vice-president and general manager of the Armstrong, Whitworth of Canada, Limited, will leave on a business trip to England about the first of October. He will be away about six or eight weeks, and during his absence his work will be temporarily taken over by Herbert Johnson.

* * *

D. F. Glass, who has been secretary-treasurer for the Montreal branch of the Navy League of Canada for the past two years, will shortly resign from this position to accept an executive position with the Ocean Accident and Guarantee Corporation, Limited, with headquarters in Toronto. His new duties will be taken up about the first of December.

* * *

In view of the increasing number of tourists coming to Montreal, the Canadian Pacific Railway Company are contemplating the rebuilding of the Place Viger Hotel. The proposed change will transfer the station hotel into a building of ten storeys. During the past summer the city has been taxed in accommodating the travelling public, and many visitors have had to seek accommodation in private houses.

It is the opinion of the officials of the Montreal Harbor Commissioners that the proposed damming of the River St. Lawrence, at Morrisburg and Long Sault, will be of enormous benefit to navigation and power development. The level of the water in the Montreal harbor will be more uniform throughout the year and the danger of floods would be practically eliminated. There is frequently a variation in water level of from 10 to 16 feet, between the spring and the fall.

* * *

Plans are now under way for the construction of a large arena in the City of Montreal, which will have a seating capacity of 6,000. While the idea is primarily one for skating and hockey purposes, arrangements are being made for interchange on summer attractions and other amusements. Plans have been prepared by Chas. M. Mitchell, architect, of Montreal, and the building will be built of wood, concrete, brick and steel. The front of the building is to be in the form of an apartment house, with the arena in the rear. Every modern convenience will be provided. The company will operate under the name of the National Sporting Club, Ltd., which is now in process of incorporation.

* * *

The Standard Equipment and Tool Works have opened an office at 179 St. James St., Montreal, for the purpose of buying and selling of all classes of machinery. They are prepared to purchase metal and woodworking machine tools, as well as contractors' and mining equipment. All machinery will be carefully inspected, repaired or rebuilt, as found necessary, before reselling to the trade. They are in the market to receive offers of entire plants which owners are disposed to sell. Joseph Presner, M.E., is managing director of the company. He was 12 years with Robt. W. Hunt and Co., the last six being spent in executive work in many of the principal offices of the company. He traveled considerably, appraising and inspecting plants and machinery in many cities throughout the United States and Canada.

BIG CONVENTION OF FOUNDRYMEN

Launching to be One of the Events for Those Who Attend Philadelphia Gathering

In recognition of and to commemorate the twenty-fourth annual convention of the American Foundrymen's Association, to be held in Philadelphia during the week of September 29, the International Shipbuilding Corporation has arranged to launch a ship at the Hog Island yard on Tuesday afternoon, September 30. This ship will be named "Afoundria" in honor of the American Foundrymen's Association and the great industry which this organization represents. The "Afoundria" will be christened by Mrs. A. O. Backert, wife of the president of the association.

The launching of the "Afoundria" at the Hog Island Shipyard will be one of the features of the boat ride on the Delaware River Tuesday afternoon, September 30. The boat will leave the Chestnut Street wharf at 1.30 p.m. The name of the ship "Afoundria" was coined from the first letters of the name of the association, namely, A. F. A. and the word foundry.

A Busy Shop.—The Electric Steel and Metals, Ltd., Welland, manufacturers of steel castings, report good business. They have recently installed new cleaning equipment, large core ovens, and sand-blasting machinery. Additions made to building during the war have thus been converted to good purpose.

Welland.—The British American Shipbuilding Co., Welland, are completing their last cargo boat on Munition Board account, and expect to deliver by the end of September. They will then proceed with two 320-foot cargo boats for the Department of Marine and Fisheries. These boats are over canal size and will be taken to Montreal in sections.

MORE ORDERS FOR THE PACIFIC YARDS

Twelve More May be Put Under Way There For Speedy Construction

According to a despatch from Vancouver the construction of twelve more steel ships in Vancouver yards may result from a conference which opened between Mr. Charles J. Fisher, of Seattle, and representatives of local builders.

Mr. Fisher has been instructed by his principals in New York to, if possible, conclude negotiations with Vancouver interests for the undertaking of a programme of constructions which may extend into 1921.

Ships similar to those recently turned out by the Coughlan yards are sought and the division of the work planned would be fifty-fifty as between the Wallace and Coughlan yards, Mr. Fisher said this morning.

Like Government Ships

"Announcement as to the conclusion of negotiations must come from Coughlan's or Wallace's," said Mr. Fisher. "The work planned calls for ships of the same type as those being turned out at the Coughlan yards. There will be changes in certain details, such as the leaving out of equipment for wartime purposes.

"It is planned to begin the work within the next two months and it is expected that one ship per month should be turned out."

Mr. Fisher's contracts would total something like $15,000,000 and would mean increasing the complement of workmen at the local yards to twice the present number. The work would keep the yards busy until the first months of 1921.

Representatives of the local yards were not prepared to discuss Mr. Fisher's visit. Upon his arrival here he was met by Capt. S. F. Mackenzie of the North-Shore yards.

Long Negotiations

It is said that the Seattle man represents Norwegian interests. He has been negotiating with Vancouver shipbuilders for six weeks past. His arrival this morning prepared to discuss the final phases of the business naturally created somewhat of a flurry.

In the event of the deal being closed contracts will be forwarded to New York for the signatures of certain of the contracting parties and Mr. Fisher says a week will probably elapse before announcement of their being signed, sealed and delivered could be officially made.

The South African Trade.—Mr. Egan, the Canadian trade commissioner to South Africa, is spending some time in this country and has been meeting many of the Canadian manufacturers with a view to explaining to them conditions in that country. There has been a report current that some Canadian firms had made a serious mistake in shipping too much to that market immediately on the signing of the armistice, while the freight rates were still very high, around the $60 mark, as against from $20 to $27 now. Mr. Egan, when asked about this, said that the situation had righted itself, and that now there was no glut in the market. Last year Canada had done with South Africa a business worth $9,704,000. The lines of goods needed in South Africa are covered pretty well in the Bulletin issued by the Intelligence Bureau, Department of the Trade and Commerce Department at Ottawa. The tractor is just getting a start in South Africa, and there should be a nice business there for a machine burning crude or coal oil. One thing is certain, and that is that if Canadian manufacturers want to get the best results from the service established by the Trade and Commerce Department they will have to co-operate. If a firm wants to know anything they should ask specific questions. This paper happens to know of one paint firm that sent word to the various trade commissioners, asking what were the prospects for them getting into the South African and Australian markets. Well, under the circumstances, all the trade commissioners could do was to send back word stating the amount of paint that had been sold and where it came from. Another paint maker sent out a list of twenty-five questions along with their color cards, analysis, prices, etc., and then asked the commissioners to answer the questions. It was possible to do so, and very satisfactory results were obtained from the field. There is an opening in the South African market for steel and iron, a fairly large amount of which is now sent in from the Canadian mills.

An Australian Visitor.—Mr. William Hoskin, of Wm. Hoskin & Sons, Sydney, Australia, engineers and jobbers, has been in this district for a few days, prior to leaving for Vancouver, from which port he will sail for home as soon as he can get passage. Trade conditions in his country are satisfactory, considering the manner in which trade conditions had been interrupted with on account of the war. "There should be a bigger opening for Canadian goods than has been made use of so far," stated Mr. Hoskins, to CANADIAN MACHINERY. "We would be pleased to get into touch with any of the Canadian makers of Canadian machinery or tools, who want to know more about the Australian field. It will be a long time yet before Australia will roll all the steel she needs, although good progress has been made in that direction, but it is not possible yet to get it out at a price." The scarcity of shipping tonnage piled up a tremendous amount of wheat in that country and now there are heaps of it waiting shipment. The feeling in Australia is favorable to Canada, but Canadians need more than catalogues to sell their goods. Mr. Hoskins claims that the best results are obtained by firms that have their goods on the field and their own men there to introduce them.

Representation in Australia.—Information in regard to this can be secured from the Intelligence Branch of the Trade and Commerce Department at Ottawa by mentioning No. 2201. A manufacturers' agent in Sydney, New South Wales, is in a position to represent reputable Canadian manufacturers in Australia and New Zealand. He will make personal visits to Melbourne, Adelaide, Perth, Brisbane, Auckland, Wellington, Christchurch, and Dunedin each buying season (twice a year), and will have resident agents in each centre. He will only do business with wholesale firms, manufacturers and large retail shops, consequently the business is big. He would require to act as the selling agent and require the selling firm to quote always c.i.f. and e. Sydney, with 5 per cent. commission included for himself. Would cable all orders for confirmation and post contracts containing speculation of colors, designs, etc., accompanied with a letter of credit for the full amount of invoice from buyers that can be drawn by sellers at sight for two to four months when shipped. Firms must give a written guarantee that all shipments are equal to their samples. Three years' agreement with, if mutually agreeable, extension for a further three to five years' period.

POINT NOT SETTLED AT OTTAWA

Continued from page 328

representatives were represented with words, the so-called capitalists had almost a monopoly of the facts and statistics given to the assembly. Labor argued from what it had been able to force on capital in the past in Canada and other countries; capital presented the statistical position of the different industries, produced evidence to show what had followed the introduction of the minimum hour day in other countries, and the present position of industry in Canada. And labor listened with smiling tolerance.

Threats Were Few

Only in a few cases was the note of intolerance struck, and it was mainly in the case of some more or less notorious labor delegates such as James Winning, one of the leaders of the Winnipeg disturbance. There were threats of what would happen if the 44-hour week did not come; but mainly labor seemed to have a supreme confidence in its strength to secure its desires.

On the whole the conference should do good. It will be an expensive matter. With about two hundred delegates, with an expense allowance of $10 a day each, and an average of about ten days from the time they leave home until they return, the "indemnity" will run into a matter of close on to $25,000; but it will have been well spent if labor and capital can be brought to see each other's problems face to face, and to learn the necessity of give and take, and of increased production to help meet Canada's enormous commitments and debts. —T.M.F.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

OBITUARY

The death is announced from Nova Scotia of Mr. George Gray, assistant general manager of the Acadia Coal Co. Mr. Gray passed away at his home in Stellarton after a short illness. His connection with the Acadia Coal Company dates from 1883, when he started as a clerk in the office in Stellarton. He advanced step by step to his position as assistant general manager. He is survived by a widow and two sisters.

PERSONAL

Wm. E. Kelly, president and general manager of the Kelly Reamer Co., Cleveland, has retired from his position, his duties being turned over to J. M. Davie, assistant general manager.

It may interest your readers to know that Mr. E. G. Buckwell, secretary and manager of sales of the Cleveland Twist Drill Company, has just returned from a three months' visit to England and the continent, where he has made a thorough trade investigation in conjunction with the European branch of the Cleveland Twist Drill Company—Cleveland Twist Drill Company of Great Britain, Ltd., London.

Purchasing Agents Meet.—The Purchasing Agents' Association of Toronto held their monthly dinner meeting at the King Edward Hotel Wednesday evening. The dinner was largely attended and a very interesting address was given by Mr. J. R. K. Bristol, manager of the Tariff Department of the Canadian Manufacturers' Association, on "The Reason for a Tariff, the Recent Changes, and the Future Outlook," which allowed a great field for discussion. The members also enjoyed a musical programme. Mr. J. I. Nicholson, of Gunns, Limited, and Mr. G. P. Biswick, of the Polson Iron Works, were elected delegates to the convention of the National Association of Purchasing Agents at Philadelphia, Pa., Sept. 22, 23 and 24.

Hercules Smart, formerly manager of the New York office of Illinois Tool Works, Chicago, has been appointed to succeed Mr. D. J. Rice as manager of the company's Detroit store.

TRADE GOSSIP

Rumored Big Concern.—It is being stated that an organization with a capital of $15,000,000, will be located in Toronto, to build locomotives.

Inducements to Industries.—The town of Deseronto is advertising its willingness to grant free sites and tax exemption to any industry locating in the city. Two large boards, containing the offer, will be erected at the railway entrances to the town.

Machine Industry Better.—From Galt comes the good news that the Canada Machinery Company employees are once more on full time. For a while the plant has been shut down Saturday all day, but the demand for wood-working machinery has so increased that full time is again necessary.

No Sign of Settlement.—The case of employees on the Welland ship canal has been taken out of the contractors' hands and is now under the jurisdiction of the Department of Railways and Canals. The men have sent a telegram to Tom Moore, President of the Dominion Federation of Labor, requesting him to get in touch with the minister, with a view to expediting matters.

Prescott to Get Coal Terminals.—The G.T.R. are said to be conducting negotiations with a view of erecting coal terminal facilities at Prescott. The project would necessitate the formation of a subsidiary company to operate a car ferry between Prescott and Ogdensburg. By this means coal that enters this country by way of Rouse's Point for Montreal and Ottawa Valley points, would be routed through Ogdensburg.

Lower Ocean Rates.—The greatly accelerated production of ocean shipping will undoubtedly soon have an effect on the rates for ocean-born freight. According to Lloyd's there are now 2,500,000 tons more steam vessel space than before the war. Another 10,000,000 tons is building, and the effect of this new cargo space on prevailing rates is sure to be in the way of reduction. In fact, some people prophesy a drop sharp enough to be termed a crash.

New Glasgow Strike Ends.—After a strike lasting less than a week, the men employed in the New Glasgow yards of the Nova Scotia Steel Co. returned to work. Some concessions were made by the company, but none of the specified demands have really been granted. The company guaranteed that on the completion of the two ships now on the stocks, a new 6,000-ton vessel will be laid down.

Good Trade Balance.—The figures for Canadian export and import trade for the month of August show up in a satisfactory manner. Exports for August, 1919, exceeded those for August, 1918, by $26,000,000, while imports for August show an increase over that month last year of only a little more than $1,000,000. Total exports for August amounted to $116,564,792, against $90,153,888, while imports amount to $81,357,485, as compared with $79,652,526.

Subsidies for Shipbuilding.—At the meeting of the Port Arthur Board of Trade a letter was read from Mr. J. F. Paige of the Port Arthur Shipbuilding Co. Mr. Paige asked for the endorsation of a petition to the Government asking for the granting of a subsidy of $10 a gross ton and $10 per indicated horse power to Canadian shipbuilders. Mr. Paige said that there was $47,500,000 invested in Canadian yards, and the pay roll was $42,000,000, while the associated industries received wages amounting to $40,000,000.

Workman Sues Iron Company for $9,000.—R. Baltschunas, a former employee of the Canadian Tube and Iron Company, Limited, Montreal, is suing this firm for $9,000, claiming, it is said, that he received permanent injuries while operating a machine used in making gun shells. In his allegation the plaintiff claims that an apparatus, which was designed to stop the machine, failed to work. He maintains that he was instructed by his foreman to apply an iron tube or pipe as a lever when he desired to halt the machine. Though what he claims to be negligence, as stated, he makes the above statement of claim. It is understood that the defendant company disclaims any liability or negligence.

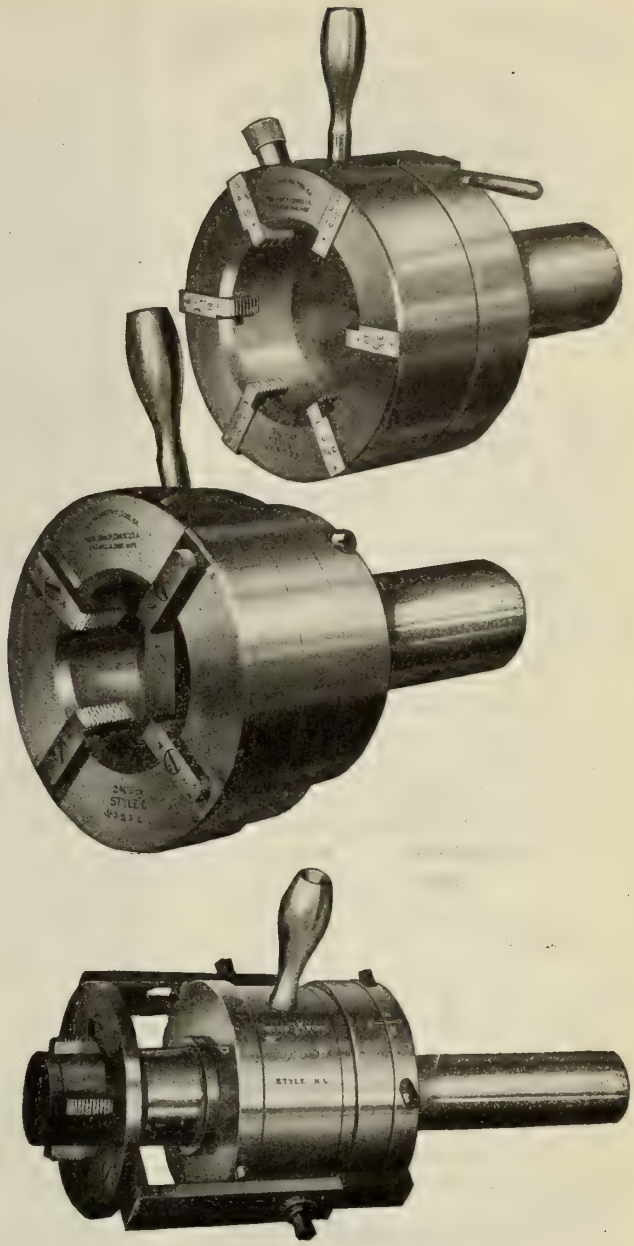
Prescott.—The town of Prescott is looking forward to the deepening of the Welland canal and is trying to secure Government docks. The water front is at present in private hands. The matter has been brought to the attention of Hon. Dr. Reid, Minister of Railways and Canals, who represents the town.

Three Rivers.—The steamer C-9, the ninth vessel built at the National Shipyards, Three Rivers, was launched successfully. The christening ceremony was performed by Madame J. A. Tesser, wife of the Provincial Minister of Highways. The company have an-

A GOOD BOON

"Geometric Tools are a good boon in our business. Always reliable and sure of turning out a class job; in fact, I don't know how we could secure a decent output without them."

This is what the Works Inspector of a London (England) shop says. He adds that they are making screw and small parts for air craft, and have quite a lot of Geometric Dies in constant use.



Because of the fact that Geometric threading tools are "a good boon" in the thread cutting business, the majority of screw machines and turret lathes are equipped with Geometrics.

other vessel to launch on the present contract, and have a further contract for four large steel vessels for a French firm.

Bought Furnace.—After an extensive investigation of the various types of electric furnaces and a visit to the U.S. Navy Yard at Puget Sound, where a 6-ton "Greaves-Etchells" furnace is in operation, the Vancouver Engineering Works, Ltd., Vancouver, B.C., has given an order to the Electric Furnace Construction Company for a "Greaves-Etchells" furnace.

Port Salon Ireland.—Salvaging the cargo of the "Laurentic," or that part of it which was formed of specie, is proceeding successfully. The strong room was blown open and a passage made for the divers. After a few buckets full of copper and silver coins had been sent up the work of salving the gold was started. The gold is sent up three bars at a time, each bar being worth about $5,000 and weighs 28 pounds. The whole cargo of bullion is valued at $35,000,000.

Toronto.—The crew of the barge "Chickamango," consisting of six men and a woman, were saved from drowning in Lake Huron by the gallant action of two men. The large was being towed by the steamer "Centurion" when she sprang a leak and sank. A heavy gale was blowing and the "Centurion" was unable to render any assistance to the crew of the barge. She therefore put into Sand Beach and blew distress signals. The tug "James Whalen," Capt. Graham, chief engineer M. Hepburn, put out and in spite of the darkness and heavy sea rescued the six men and the woman. The American life-saving station rescued three more.

Open New Office.—The Carborundum Company announces the opening of branch offices and warehouse in Detroit, Mich. The new Detroit quarters will be located in the Burkhardt Building at Second and Larned Streets. The Detroit branch is under the management of Mr. Anthony Dobson, who will have charge of the Detroit sales district. The new offices and the warehouse are opened with a view to giving quicker and better service to the users of Carborundum products in the Detroit district.

Machinery Wanted in France.—Hon. Philippe Roy, Commissioner General for Canada in Paris, France, reports that Captain Bisson, of the "Office de Reconstitution Industrielle des Departments Victimes de l'Invasion," 14 Rue de la Tremoille, Paris, would like to get into communication with Canadian manufacturers who can make prompt delivery of the following articles and the prices at which they could supply: Vertical lathes, milling machines, shaping machines, automatic lathes, machines for rolling mills, mortising (slotting) machines, planing machines, boring machines, grinders.

Brantford Planning. — Following out the plan that has been adapted with advantage by some of the larger American cities, Brantford is considering the formation of a City Planning Commission,

which would consider and pass upon all municipal improvements of any kind, such questions as zoning, streets, buildings, parks—everything having to do with growth and development along systematic lines. What is more, Brantford has in view a population of 50,000 or more, and after all is said and done the people realize that it is desirable to have a city that will compare favorably with any.

Robbins and Myers' Plant.—The Robbins & Myers Co., Springfield, O., manufacturers of generators, electric fans and motors, are locating a Canadian factory in Brantford. It is announced that they will erect a factory on what is known as the Waterworks property, occupying ten acres. The concern will begin operations with about 300 employees. The industrial commission of Brantford is negotiating with several other firms planning to open branches in Canada.

Scrap Prices High.—Reports from the Welland and St. Catharines districts place values of from $13 to $16 a ton on available high-grade munition scraps, with every indication of still higher prices.

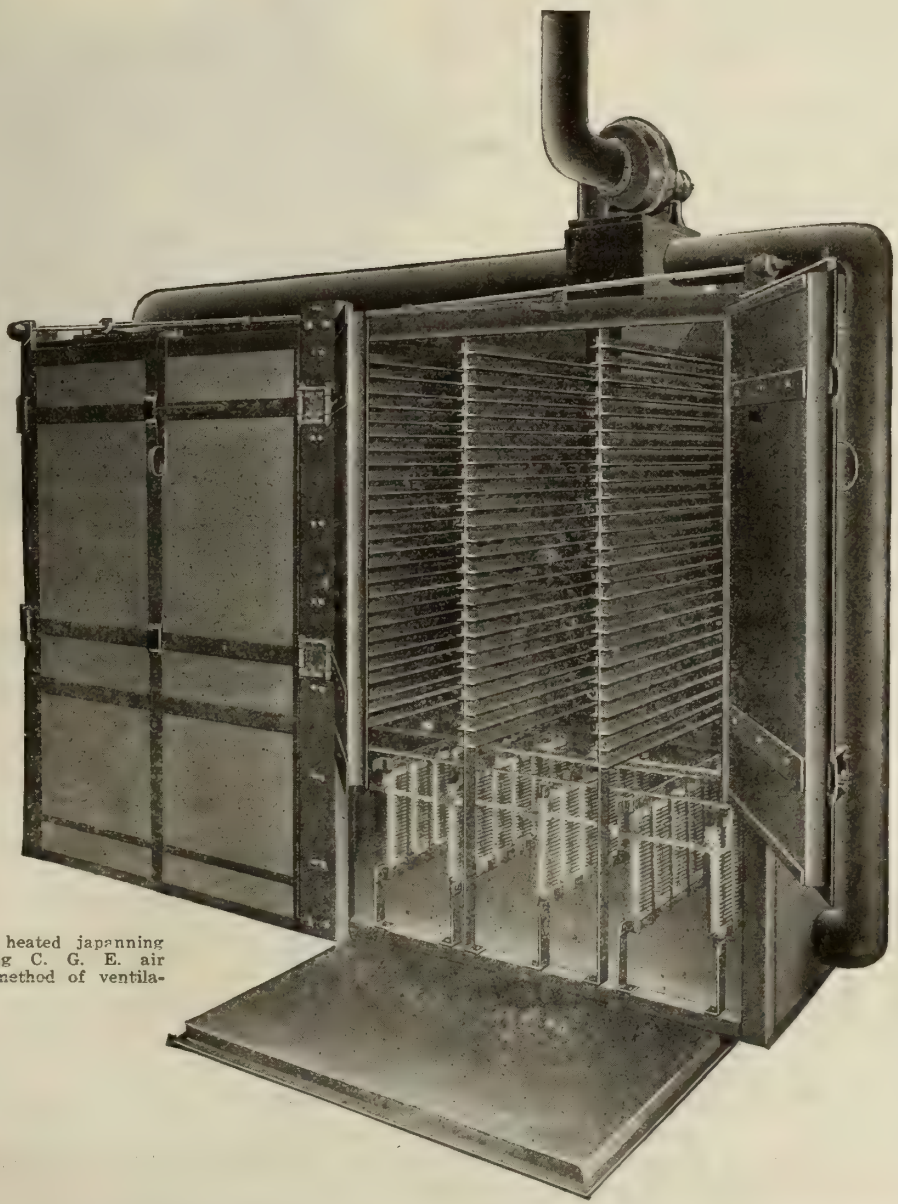
C. G. E.
Electric Ovens



Electrically heated japanning ovens showing C. G. E. air heaters and method of ventilation.

Experience proves that electric heating gives perfect heat distribution and permits greater flexibility in temperature control than can be obtained with fuel. The resister material in C.G.E. Heaters is capable of enduring a continuous heat of 800° C. (1472° F.). It is carried on insulating material which maintains its insulating qualities at 1000° C. (1832° F.) with no expansion or contraction.

4¾ Min.

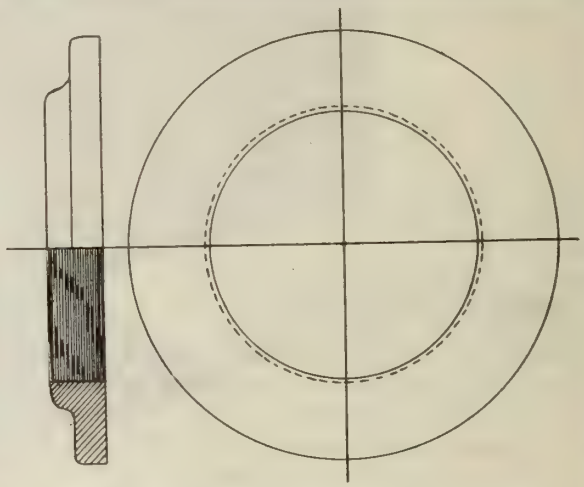
To Complete Operation on this 125-lb. Standard Cast Iron Piece with

SMALLEY-GENERAL THREAD MILLER

Milling and facing a standard cast iron flange in 4 min. and 45 sec. is a performance that must appeal to every machinist. This is what the Smalley-General Thread Miller accomplished, on the piece illustrated herewith. This is saving time and cutting costs with a vengeance.

Have you a manufacturing proposition that needs stimulating? Then the Smalley-General Thread Miller is the machine you need.

Send us blue prints, or actual piece of work. Our engineers will then show you how our Miller will turn out the work for you.



Typical Operation and Time Study

Machine—Smalley General Flange Thread Miller No. 1. Air operated collet Chuck.
Piece Milled and Faced—Standard cast iron 125 lb. pressure 8" flange. Facing 13½" O.D. x 8¾" I.D.
Thread—8⅜" diameter, 1¾" long, 8 pitch Briggs tapered.

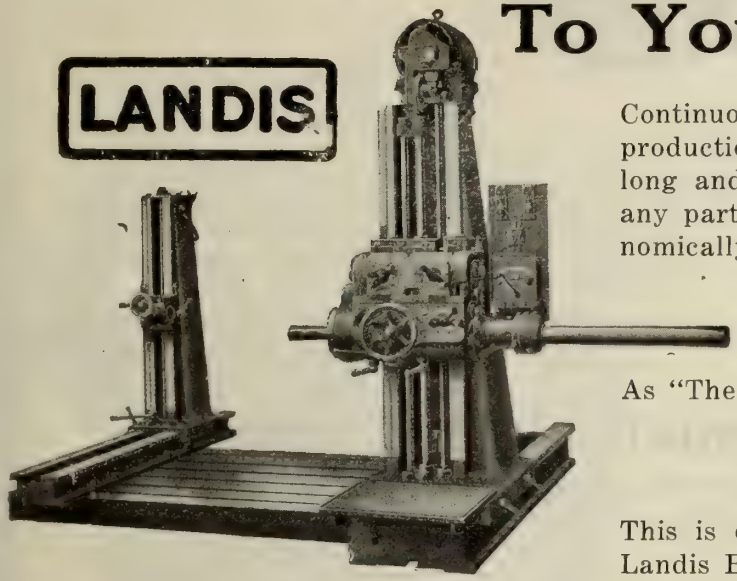
Time study—	Min.	Sec.
Chucking from floor	..	15
Facing ⅛" feed	1	40
Adjusting hob	..	10
Milling	2	30
Removing from chuck	..	10

Time complete operation, floor to floor.. 4 min. 45 seconds
Milling Feed—10½" per minute. Limits .003. Entire flange finished in one chucking. Face and threads in perfect alignment.

SMALLEY-GENERAL CO., Inc., BAY CITY, MICH.

Canadian Agents: Rudel-Belnap Co., Ltd., Montreal and Toronto

Does Continuous Operation Mean Anything To You?



Continuous operation means more than super production; it means the ability to withstand long and continued abuse without failure in any part and yet produce accurately and economically.

As "The Cincinnati Planer Co." states:

"It is operating night and day, on very heavy work, without a moment's trouble, and is giving first class satisfaction."

This is only part; send for catalog covering Landis Boring, Milling and Drilling Machines.

60 Rivets in a Minute

Faster if the work can be fed faster.
But at least 60 every minute.
And in tightest corners just as fast. Every head just as smooth. Not a bent shank; not a tool mark on either rivet head or casting.

GRANT

Rivet Spinning Machines

handle any rivet up to ¼-in. shank.
If Grant-made, every hard steel rivet is finished as smooth and as true as every rivet of soft brass.
The Grant Book called "Perfect Riveting" tells how to give an extra appearance of quality to your product. For your copy

"There's a Drill Speed **NATCO** *for Every Need"*

The Detroit Gear Grinding Machine Company use NATCO Multi-Drillers in completing the drilling of 46 Clutch per hour. Each hub has four ⅜-in. and four 25/64-in. holes which are drilled ⅜-in. deep in one operation. In the next operation four of the holes are countersunk.

Change of Speed for each Spindle permits each tool to remove its proportional amount of metal. Idle spindles are in neutral, saving wear and power. Results are greater production with less wear and breakage of drills.

If you have more than one hole to drill in a given piece there's a NATCO for the job. **NATCOS are built in 11 sizes, ranging from 2 to 72 spindles.**

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

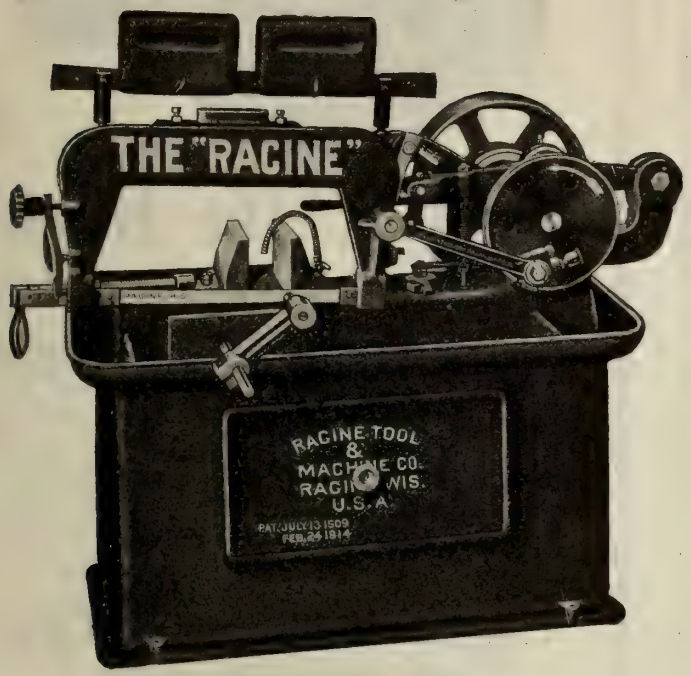
Standard the World Over

"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic liftting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades
